# cdma2000 Receiver Tests Under Fading Conditions with R&S<sup>®</sup>CMU and R&S<sup>®</sup>ABFS

# **Application Note**

This application note describes how to generate cdma2000 signals for wide ranging receiver tests under fading conditions for cdma2000 450/Cellular/PCS/IMT-2000 mobile and base station equipment. The test setup requires an R&S<sup>®</sup>CMU200 / CMU300 Universal Radio Communication Tester with option R&S<sup>®</sup>CMU-B17 IQ-IF interface and a R&S<sup>®</sup>ABFS Base Band Fading Simulator. The cdma2kFadLevCor program included with this application note performs an automatic level correction of the power fed to the User Equipment (UE) by adding a RF power offset equivalent to the IQ path loss.

# **1** Overview

The signal strength and quality of signals received by Base Stations (BS) and Mobile Stations (MS) can be influenced by effects resulting from the movement of the mobile, and the overlay of numerous delayed signals caused by reflections. This phenonemon is called fading and is classified in profiles such as Constant Phase, Pure Doppler, Rice, Rayleigh and Moving Propagation fading. This application note describes how to connect a R&S<sup>®</sup> Radio Communication Tester CMU with IQ-IF interface option CMU-B17 to a R&S<sup>®</sup> ABFS baseband fading simulator for generating cdma2000 signals suitable for tests under fading conditions according to specification C.S 0011-B. The supplied program cdma2kFadLevCor calibrates the attenuation of an external fading simulator ABFS connected to the CMU IQ loop. cdma2kFadLevCor can also calculate the mathematical signal loss resulting from various fading profiles and noise influence and automatically adds an equivalent offset to the CMU RF power.

The following abbreviations are used in the following text for  $R\&S^{\ensuremath{\mathbb{R}}}$  test equipment:

- The R&S<sup>®</sup>CMU200/CMU300 Universal Radio Communication Tester is referred to as CMU.
- The R&S<sup>®</sup>ABFS Base Band Fading Simulator is referred to as ABFS.
- R&S<sup>®</sup> means Rohde & Schwarz GmbH und Co KG

# 2 Software Features

- Program and device configuration storage
- Auto detection of ABFS fading model and active paths
- Variable CMU GPIB secondary address setup
- Automatic Insertion Loss calibration routine
- Quick calculation of the RF power compensation factor affected by fading effects and Additive Gaussian White Noise.

# **3** Hardware and Software Requirements

## **Hardware Requirements**

The software runs on a PC with

CPU	Pentium 330MHz or better
RAM	128 MBytes or more
MONITOR	SVGA color monitor 800x600 or better
IEC/IEEE BUS	IEC/IEEE bus interface Rohde & Schwarz IEEE-488.2 bus interface <b>PS-B4</b> , 1006.6207.04, or National Instruments <b>AT-</b> <b>GPIB, PCI-GPIB</b> or <b>PCMCIA-GPIB</b> card.

# **Software Requirements**

WINDOWS 98SE/NT/2000/XP	Microsoft operating system
NI-488.2 ∨1.7 (or above)	IEC/IEEE – bus driver from National Instruments. See <u>http://www.natinst.com</u> for latest revision.
NI-VISA v3.0 (or above)	VISA driver from National Instruments. See <u>http://www.natinst.com</u> for latest revision.
MICROSOFT INSTALLER	Versions for Windows 95/98/NT are available at <u>http://www.rohde-schwarz.com</u> . Not required for Windows 2000/XP.

**Note:** In case only the NI-488.2 GPIB driver is installed but no VISA driver the program will react as if there were no device connected to the GPIB bus.

# 4 cdma2000 Fading on Baseband Level (IQ) with CMU and ABFS

### **Connecting the Instruments**

### **CMU and ABFS**

Connect the controlling PC to the CMU and ABFS with a GPIB bus cable. The ABFS is additionally connected to the CMU in the IQ RX (mobile station) or TX (base station) loop with the cable no. 1100.6993 which is included in the CMU-B17 option. The UE (user equipment) or BS (base station) is connected to the RF2 connector of the CMU which is set to bidirectional operating mode (input/output).

Fig. 1 CMU and ABFS Connection

### Basics of Fading Tests with IQ IF Loop

The ABFS adds fading and noise effects to the CMU signal on the IQ level (baseband). When an ABFS is inserted into the CMU IQ loop by switching the CMU-B17 option, the signal power decreases due to the losses on the switched path. The ABFS displays a general insertion loss depending on the number of active fading channels and appropriate channel losses which applies to the worst case (all channels turned on) to avoid overdrive at the CMU IQ input. In order to maintain a defined signal level at the UE the CMU generator level setting must compensate this insertion loss. This is achieved by setting the EXTERNAL ATTENUATION parameter of the CMU generator to the value of this insertion loss.

The ABFS fading simulator supports several cdma2000 fading standards (CDMA 8, CDMA 30, CDMA 100) with multiple paths and profiles (Rayleigh, Pure Doppler, etc.).

A power component (Fading Gain) resulting from the sum of the power of each path must be added to the Insertion Loss loss in order to obtain the correct total loss of the ABFS IQ path.

Additive white Gaussian noise (AWGN) is added to simulate the presence of communication traffic at the input of the receiver under test.

The following schematic shows the signal paths and their calculation.

Fig. 2 Fading with IQ IF Loop

#### **Insertion Loss**

The **INSERTION LOSS** is defined in the program **CDMA2KFADLEvCOR.EXE** as the ABFS insertion loss plus of the loss of the IQ cable to and from the CMU. It must be measured only once for each hardware configuration.

Note: The ABFS insertion loss is 12dB with INSERTION LOSS SETTING MODE -> AUTO and can be varied from 6 to 24dB with INSERTION LOSS SETTING MODE -> MANUAL.

#### Fading Gain

The **FADING GAIN** is the gain caused by the sum of various fading paths power components. This value is usually positive for standard fading profiles with at least one path with 0dB loss. The **FADING GAIN** must be updated each time the fading profile is changed and is calculated as follows:

FadingGain = 
$$10 * \log \left( \sum_{n=1}^{N} 10^{\frac{-PnLoss}{10}} \right)$$

 $P_{nLOSS}$  = Loss of n-th path (appears as negative gain in the formula). The maximum number of paths is N = 12 for the ABFS.

Since the paths are switched together in parallel, the sum of the power amplification factors (delogarithmized path losses) must be added and the resulting sum logarithmized.

**Note:** The formula above applies to fading profiles consisting of non correlated signal paths (usually Raleigh for all standards). The calculated result will not be precise as soon as the fading profile contains at least two correlated paths (e.g. CPHAS), since their calculation is voltage instead of power based.

#### **AWGN Level**

The AWGN Level is the additional amount of power applied to the UE by adding White Gaussian Noise with a specified signal to noise ratio to the faded signal. The following schematic and formulas show the functional layout of the IQ path and its calculation.

Fig. 3 IQ Path

The CMU I or Q output supplies a peak voltage of:

$$Upp = 0.5V$$

The corresponding level  $P_{MAX}$  at a 50 Ohm terminated lead is:

$$P \max = 10 * \log \left( \frac{Upp^2}{50\Omega * 1mW} \right)$$
$$= 10 * \log \left( \frac{0.25W}{0.05W} \right)$$
$$\approx +7dBm = 0dBfs$$

The dynamic margin for cdma2000 signals is factory set to

$$DynMar = 9.00dB$$

The cdma2000 IQ baseband power level  $\mathsf{P}_{\mathsf{CMU}}$  at the CMU-B17 outputs is factory adjusted to:

$$Pcmu = P \max - DynMar$$
$$= 7dBm - 9.00dB$$
$$= -2.00dBm$$

The output power of the fading simulator FSIM (Îor) is calculated as:

$$\hat{I}or / dB = Pcmu - InsertionLoss - FadingGain$$

The power supplied by the noise and distortion simulator NDSIM ( $\hat{l}oc = AWGNLevel$ ) is referenced to 0.5Vpp = +7dBm. The maximal AWGNLevel possible on the ABFS is -17dBfs = -10dBm. The basic system bandwidth (SysBw) is 1.23MHz:

$$\hat{I}oc / dB = P \max + AWGNlev - 10 * \log\left(\frac{SysBw}{1.23MHz}\right)$$

The signal to noise ratio SNR is defined in the cdma2000 test standard (e.g. SNR = 8dB) and depends on following formula:

$$SNR / dB = \hat{I}or / dBm - \hat{I}oc / dBm$$

= *Pcmu* – *InsertionLoss* – *FadingGain* – *P* max

$$-AWGNlev + 10*\log\left(\frac{SysBw}{1.23MHz}\right)$$

**Note:** The noise spectral density of ABFS is flat within 1.4 times the set system bandwidth. This means, with a system bandwidth of 1.23MHz you obtain flat noise within 1.722 MHz. IS98 however specifies 1.8 MHz noise bandwidth. In our opinion, 1.722 MHz is sufficient for all hardware tests. This needs no further correction to the formulas given. For all cases, where a noise bandwidth of 1.8 MHz is mandatory, we suggest to set the system bandwidth of ABFS to 1.8 MHz / 1.4 = 1.286 MHz. In cdma2kFadLevCor AWGNLev is compensated depending on the System Bandwidth.

The ABFS accepts only the (absolute) AWGN level so the formula above needs to be solved accordingly (e.g. InsertionLoss determined by calibration=11.99dB, FadingGain for CDMA 100 fading profile with 3 paths = 3.98dB).

$$AWGNLvl = Pcmu - InsertionLoss - FadingGain - P \max - SNR$$
$$= -2.00dBm - 11.99dB + 3.98dB - 7dB - 8dB$$
$$= -25.02dBm$$

After adding AWGN to the signal the output power is:

$$OutputPower = 10 * \log \left( 10^{\frac{10r}{10}} + 10^{\frac{10c}{10}} \right)$$
$$= 10 * \log \left( 10^{-1.83} + 10^{-1.03} \right)$$
$$= -9.66 dB$$

<u>Example:</u> CDMA 100 fading profile (3 paths with 0dB, 0dB and 3dB path losses) and SNR 8dB. The **INSERTION LOSS** has been measured according to the calibration routine (e.g. 11.99dB) described in the section "Calibrating the Insertion Loss". The **FADING GAIN** is calculated as shown on p.7 and the **Rx/Tx CABLE LOSS** has been measured or is specified by the manufacturer (e.g. 1.0 dB). The **EXT**ernal **ATTEN**uation **OUTPUT** is calculated as:

*ExtAttenOutput = InsertionL oss - FadingGain + RxCableLos s* 

$$= InsertionLoss - \left(10 * \log\left(10^{\frac{-Path1Loss}{10}} + 10^{\frac{-Path2Loss}{10}} + 10^{\frac{-Path3Loss}{10}}\right) + 1.0\right) dB$$
$$= \left(11.90 - 10 * \log\left(10^{\frac{-0}{10}} + 10^{\frac{-0}{10}} + 10^{\frac{-3}{10}}\right) + 1.0\right) dB$$
$$= (11.99 - 3.98 + 1.0) dB$$
$$= 9.01 dB$$

This precise calculation method makes an additional power measurement at the UE input obsolete after changing the fading profile.

#### **Rx and Tx Cable Loss**

The **Rx CABLE LOSS** is the attenuation of the cable from CMU RF2 output connector to the UE and must be specified or measured separately. The same applies for the **Tx CABLE LOSS** which is the attenuation from the UE to the CMU RF2 input. When the combined CMU input/output RF2 is used with one cable connected to the UE, the **Rx** and **Tx CABLE LOSS** are equal. When using a custom UE adaptor with directional coupler they will differ.

**Note:** When the CMU reaches its calibration deadline it may occur that the RF generator level is close to the specified limits. An offset of 0.5dB, for instance, enormously effects all types of error rate measurements (BLER, FER). In case the actual CMU RF output power is less than the nominal level, this may be compensated by increasing the **Rx CABLE Loss** by the difference. In case the measured power is higher than the nominal value the **Rx CABLE LOSS** must be decreased by the difference.

# **5** Installing the Level Correction Software

The following installation files are required to install the level correction software CDMA2KFADLEVCOR on the controlling PC.

#### CDMA2KFADLEVCOR V1.XX.MSI

#### DISTFILE.CAB

Execute cdma2kFabLevCor v1.xx.MsI and select the installation directory. A new menu item cbMa2kFabLevCor is created in Start -> Program FiLes. The installation directory contains the files named below:

CDMA2KFADLEVCOR.EXE	Executable
CDMA2KFADLEVCOR.CFG	Configuration file
CDMA2KFADLEVCOR.CHM	Online help manual

Before running CDMA2KFADLEvCOR assign at least one of the desired CDMA SIGNALLING and NON-SIGNALLING function groups to one or more of the 29 possible GPIB secondary addresses (1..29) on the CMU.

Ch. 1 CDMA2000 <sup>N.Amer.</sup> Analyzer / Gen.					
😑 Setup					
-Setup		- Secondary Address [GF	PIB]/Address 2		
<ul> <li>SCPI Connection</li> <li>Primary Address [GPIB]</li> <li>Secondary Address [GPIB]</li> </ul>	Function Group	Mode

Address 7 Address 8	Not Mapped Not Mapped				
Address 9 Address 10	Not Mapped Not Mapped				
Address 11 Address 12	Address 11 Not Mapped Address 12 Not Mapped				
Print Remote Comm.	Options Time	Misc.			

Fig. 6 CMU GPIB secondary address setup

# 6 Running the Level Correction Software

This section describes the program's menu items and controls. Start **CDMA2KFADLEvCOR.Exe** on the PC. The program's purpose is to set the CMU external generator attenuation to the calculated ExtAtten value so the CMU generator output level display shows the signal power actually applied to the UE.

# **Controls and Indicators**

cdma2kFadLevCor has two different operating modes, the **CALIBRATION MODE** which is used obtain the **INSERTION LOSS** and the **MEASUREMENT MODE** which allows calculation of the **FADING GAIN**.

#### **Calibration Mode**

The **CALIBRATION MODE** is used to measure the hardware dependant **INSERTION LOSS** resulting from the nominal ABFS ILOSS (insertion loss) setting and the loss of the IQ connection cables. The **INSERTION LOSS** is usually ILOSS  $\pm$  0.05dB depending on the hardware configuration. In **CALIBRATION MODE** the **INSERTION LOSS** and **CALIBRATE** controls are highlighted and the CMU **EXT**ERNAL **ATTEN** uation is turned **OFF**.

**Note:** Allow sufficient warm-up time for the CMU and ABFS in order to obtain correct measurement results.

Fig. 10 Main Window Calibration Mode

- Generator RF FREQ Control for CMU generator frequency. The analyzer RF FREQuency indicator is automatically set to the same value. Range 10MHz to 2700MHz.
- Generator **RF LvL** CMU Generator RF level. Range -120dBm to -16dBm.
- Analyzer **RF Freq** Indicator for the CMU analyzer frequency.
- Analyzer **REF.LEVEL** Control for CMU analyzer reference level. Range -43dBm to 44dBm.

- **GET CONFIG** reads the following CMU generator and analyzer settings.
  - Generator RF FREQUENCY (non signalling) or CHANNEL (signalling). The ABFS is automatically set to the RF frequency corresponding to the CMU generator CHANNEL in signalling mode.
  - o Generator RF LEVEL
  - o Analyzer RF FREQUENCY
  - o Analyzer REFerence LEVEL
- **MODE** chooses between **CALIBRATION** and **MEASUREMENT** Mode. The ABFS is automatically set to the RF frequency corresponding to the CMU generator CHANNEL in signalling mode.
- **INSERTION LOSS** Attenuation of the IQ path as determined manually or by pressing the **Calibrate** button (see section 'INSERTION LOSS' on page 6 for further details).
- CALIBRATE Performs full automatic calibration and updates the INSERTION LOSS indicator.

#### **Measurement Mode**

The **MEASURMENT MODE** is used to calculate the **FADING GAIN**, switch the CMU to signalling mode and turn on the CMU-B17 fading path. In **MEASUREMENT MODE** the **CALCULATE** button and **FADING GAIN** indicator are highlighted and the CMU **EXT**ernal **ATTEN**uation is turned **ON**.

Fig. 11 Main Window Measurement Mode

- Generator UL/DL CHANNEL Control for the UpLink/DownLink Channel.
- DYNAMIC MARGIN CMU I/Q baseband RMS output power ratio to full scale. 0 dBfs = +7dBm. The baseband power P<sub>CMU</sub> = +7 dBm – 9dB (factory default) = -2 dBm (see p.9).
- FADING GAIN Gain resulting from sum of various fading paths. It is calculated by pressing the CALCULATE button as shown in the section 'Basics of Fading Tests with IQ/IF Loop' (page 5).
- **CALCULATE** Reads the current fading parameters and updates the appropriate indicators as necessary. **FADING GAIN** is updated with the calculated value.
- SNR Signal / AWGN ratio control prescribed by test specification.
- SysBW ABFS AWGN system bandwidth control.
- AWGN LvL AWGN level in relation to IQ full-scale (= 0.5V<sub>p</sub>). If the calculated value (by pressing CALCULATE or changing Îor/loc or SysBW) is out of range (-50dBm <= AWGN level <= -17dBm) a warning appears and by pressing Oκ the active ABFS path losses are increased accordingly.</li>

Fig. 12 AWGN Level Range Warning

- **Note:** The ABFS path losses are reset as soon as you choose a fading profile from the **PROPAGATIONS CONDITIONS** menu in UtraFadCal or manually on the ABFS.
- **Ioc** Control for absolute AWGN power as defined in the cdma2000 specification.
- Rx CABLE LOSS the user specified attenuation for the cable from the RF2 connector to the UE including the coupling loss for test adaptors. The Rx CABLE LOSS is added to the level offset EXT ATTEN. This control may be used to compensate CMU RF level offsets (see p.10).
- **Tx CABLE LOSS** the user specified attenuation for the cable from the UE to the RF2 connector. **Ext Atten Input** is automatically set to **Tx CABLE LOSS**.
- EXT ATTEN OUTPUT Indicator for level offset which is applied to the output power to compensate for INSERTION LOSS, FADING GAIN, and RX CABLE LOSS.

*ExtAttenOutput = InsertionLoss - FadingGain + CableLoss* 

CDMA2KFADLEVCOR displays the following error message in case the CMU generator exceeds its maxium output level due to the EXT ATTEN OUTPUT value. If this error occurs press OK and enter the correct parameters.

🐺 Warning	8	×
Level exceeded maximum de	evice lev	el!

Fig. 13 Level Warning

- **EXT ATTEN INPUT** Indicator for the level offset which is applied to the input power to compensate for **TX CABLE LOSS**.
- **Note:** The **EXT ATTEN OUTPUT** and **INPUT** displays are automatically updated when the **CALIBRATE** or **CALCULATE** buttons are pressed or the **Rx** or **Tx CABLE LOSS** values are changed manually. In **MEASUREMENT** Mode the **EXT ATTEN OUTPUT** and **INPUT** values are immediately transferred to the CMU.

# **Calibrating the Insertion Loss**

The program CDMA2KFADLEVCOR performs an automatic calibration of the **INSERTION LOSS** after pressing the **CALIBRATE** button. This sections describes how this procedure may be done manually.

The **INSERTION LOSS** is device dependant and must be determined only once for an individual setup (CMU + ABFS + IQ connection cables, see fig. 2). This measurement setup uses RF2 as output and RF1 as input.

Fig. 14 Calibration Configuration

1. Switch the fading simulator to **STANDARD...** -> **CALIBRATION MODE** (1 path, CPHAS profile, 0.0dB path loss). This sets the **FADING GAIN** to zero and the measured value will only reflect the **INSERTION LOSS**.

6. The resulting Average MS Power  $P_{\text{MEAS}}$  (Fig. 23) must be subtracted from the reference power  $P_{\text{REF}}$  (Fig. 21) to obtain the **INSERTION LOSS** of the IQ path.

InsertionLoss = 
$$P_{REF} - P_{MEAS} = -16.9dBm + 28.8dBm = 11.9dB$$

# 7 Testing MS Receiver Quality with FER-FCH Measurements Under Fading Conditions and AWGN

A criteria for MS or BS receiver quality is the frame error rate of the fundamental channel (FER-FFCH) which is specified in the cdma2000 test specification *3GPP2 C.S0011-B* for mobile stations and in *3GPP2 C.S0011-B* for base stations.

### How To Use the Test Specification

The following example describes the relevant parameters for performing the test case **3.4.2 DEMODULATION OF FORWARD FUNDAMENTAL CHANNEL** with **RADIO CONFIGURATION 1** with **CASE 1** (see table below taken from the test specification 3GPP2 C.S0011-B).

Case	Radio Configuration	Channel Simulator Configuration Number
1	1	1 (8 km/h, 2 paths)
2	1	3 (30 km/h, 1 path)
3	1	4 (100 km/h, 3 paths)
4	2	1 (8 km/h, 2 paths)
5	2	3 (30 km/h, 1 path)
6	2	4 (100 km/h, 3 paths)

Fig. 23 Channel Simulator Configuration Table

The test parameters for this test case are summarized in the according table A.2.2.1-1 and are highlighted.

Parameter	Units	Test 1	Test 2	Test 3

Fig. 24 Table A.2..2.1-1 of C.S001-B

 $\hat{I}_{or}/I_{oc}$  is the Signal to Noise Ratio (SNR) between the CDMA Power  $\hat{I}_{or}$  and the AWGN signal level  $I_{oc}$ . This value (8dB) must be entered in the CDMA2KFADLEVCOR program which automatically calculates the **AWGN LEVEL** (see p.8 for details on its derival) and sends it to the ABFS. Since the ABFS AWGN level allows only 0.05 dB steps there may be a small difference between nominal and actual value.

SNR 🗧	8.00	dB		AWGN A1				
SysBW	1.23	MHz	OFF	SIGNAL+NOI 17.8	ISE MU	SIGNAL	NOISE -28.95 1.23	dBfs MHz

loc	-63.00	dBm						
Fig. 25 AWGN	Level							

The source code for remote ABFS AWGN level setting is shown in appendix A-1.

**Pilot E**<sub>c</sub> / I<sub>or</sub> is the ratio between the pilot signal (**PICH LEVEL**) and the CDMA Power I<sub>or</sub>. It must be set manually on the CMU as shown below.

Fig. 27 FCH Level

 $\hat{I}_{oc}$  is the AWGN level at 1.23MHz system bandwidth (-63dBm). Depending on  $\hat{I}_{or}/I_{oc}$  the CDMA Power is calculated as:

**CDMA Power** =  $\hat{I}_{oc}$  + SNR = -63dBm + 8dB = -**55dBm**.

Fig. 31 SCH0 Data Rate

**Traffic E**<sub>b</sub> / N<sub>t</sub> is for information purposes only and is not relevant for the test. The corresponding value on the CMU does not apply because it is related to CMU internal AWGN without fading.

Now the **CHANNEL SIMULATOR CONFIGURATION** number must be selected with cdma2kFadLevCor. **CDMA 8, 2 Paths (BC0..11)** stands for simulation of a CDMA MS moving with 8 km/h speed, receiving the signal from two separate paths (direct and reflected path). BC0..11 applies for band classes 0 to 11.

				Channel S	Simulator Co	nfiguration		un
Channel Simulator	1 =	<b>€</b> 1.0 <b>√</b> 1	CDMA 8, 2 - CDMA 8	2 Paths (BC I 3, 2 Paths (B	011) C 011)		، rot ۱

Fig. 32 Channel Simulator Configuration

While the ABFS offers three channel simulator configuration types via quick selection buttons (CDMA 8 - 2 Path, CDMA 30 – 1 Path, CDMA 100 – 3 Paths) cdma2kFadLevCor allows quick selection of all channel simulator configurations defined in the specification.

Fig. 33 ABFS Channel Simulator Configuration

The source code on appendix A-2 shows how to select channel simulator configuration 5 (CDMA 0 - 2 Paths) in an own test application.

Keep in mind that the **FADING GAIN** may change when the fading profile is varied and needs to be updated in **CDMA2KFADLEvCor** (see p.7 for details on the **FADING GAIN** calculation). Appendix A-3 shows the remote command sequence for the automatic **FADING GAIN** calculation.

## **Calibration and Test Procedure**

This section contains a step by step guide that shows how to calibrate the **INSERTION LOSS**, prepare and perform a FER measurement under condition of fading as prescribed in the CDMA2000 test specifications for user equipment.

- For the calibration procedure connect RF2 (defined as output) with RF1 (defined as input) on the CMU. The RF1 input signal is not attenuated by a directional 20dB coupler as it would be in RF2 and is therefore more sensitive.
- 2. Start CDMA2KFADLEVCOR.EXE and press the INIT buttons (see section DEVICES, p.14).
- 3. Switch to CALIBRATION MODE in CDMA2KFADLevCor. This will set the CMU CDMA POWER to the maximum level -16dBm.

Fig. 34 cdma2kFadLevCor Calibration Setup

- Set Generator RF FREQuency and RF LeveL to desired value, e.g. 1955 MHz and -16.00 dBm. The Analyzer RF Frequency is automatically set to the same value. This may be checked by pressing the GET SETTINGS button.
- 5. Determine the **INSERTION LOSS** by pressing the **CALIBRATE** button. The calibration takes approx. 40s and is ready when the **CALIBRATE** button is no longer dimmed.

6. Switch to **MEASUREMENT MODE** which automatically updates the CMU external attenuation with the **EXT ATTEN** value and switches the CMU-B17 Fading path ON.

Fig. 35 cdma2kFadLevCor Measurement Setup

Fig. 36 RF Connector Setup

By switching to **MEASUREMENT MODE** the ABFS **RF FREQUENCY** is also automatically set to the CMU generator (BS) RF frequency. This corresponds to the following manual procedure on the ABFS:

#### GROUPA FSIM -> STANDARD FAD -> RF FREQUENCY -> e.g. 1955.0MHz

- Select the desired fading profile. CHANNEL SIMULATOR CFG -> 1- CDMA 8, 2 PATHS (BC 0...11) -> SET. Close this menu with QUIT.
- Calculate the FADING GAIN by pressing the CALCULATE button (= 3.01dB for CDMA 8, 2Paths). This also updates the AWGNLvL display. Make sure that SYSBW ≥ 1.23MHz.

- 9. Optionally edit **Rx** and **Tx CABLE LOSS**, e.g. 1.00dB. It can be determined as described in section *Controls and Indicators*, page 17.
- 10. Disconnect the cable from **RF1** (in) and connect it to the MS.
- 11. To select the FER-FCH test choose MENU SELECT -> IMT-2000 MOBILE STATION -> CDMA2000 PCS -> SIGNALLING mode -> RECEIVER QUALITY -> FER-FCH on the CMU.
- 12. Select 1st Service CLASS -> LOOPBACK SERVICE (TEST).
- 13. Select NETWORK STANDARD -> e.g. BC1 (Bandclass 1): N.AMERICAN PCS

	) <b>00 <sup>N.Amer.</sup> Rece</b> i	iver Quality Contract of the state of the st	Connect Control

		Standby Access Probe	Power
Connection Handoff S	ervice Cfg. BS Signal	Network RF 🕞 Sync.	<u>1</u> 2

Fig. 37 Connection Control

- Select CONNECT CONTROL -> BS SIGNAL SETTINGS -> RF CHANNEL, e.g. 500 (Foward Link 1955MHz, Reverse Link 1875MHz). You may also set the channel in cdma2kFadLevCor by setting the GENERATOR RF UpLink/DownLink CHANNEL.
- 15. Select **CONNECT CONTROL** -> BS Signal -> **CDMA Power** (Signalling) -> e.g.-35dBm (a higher level is required for mobile registration).
- 16. Register the mobile by switching the power on.
- 17. Establish a cdma2000 PCS connection dialing a number on the MS or by pressing **CONNECTION** -> **CONNECT MOBILE** on the CMU and accepting the call on the MS.
- 18. Optionally set **FER-FCH** -> **STOP CONDITION** -> **NONE** in case precise measurement values are required for statistical reasons.
- 19. Set **FER-FCH** -> **FRAMES** -> i.e. **9000 FRAMES** for conformance tests.
- 20. Select CONNECT CONTROL -> BS SIGNAL LEVEL -> CDMA POWER -> -55 dBm (see p. 26 for description). You may also change the CDMA Power by editing SNR, SYSBW or IOC in CDMA2KFADLEVCOR MEASUREMENT MODE.

21. The resulting FER-FCH is displayed on the CMU.

Fig. 38 FER-FCH Measurement

## **Measuring FER Characteristic**

While the specification mainly applies for production tests, developers may need more information in order to classify devices such as a FER-FCH error rate vs. the S/N Ratio. The example below was performed with a CMU200, ABFS and a CMU-Z10 shielded chamber for mobile stations. If no mobile station RF adapter is available use the CMU-Z11 antenna coupler.

Fig. 39 FER-FCH vs. S/N Ratio
