ATTENUATORS, MATCHING PADS, TERMINATIONS AND ULTRA BROADBAND LOAD

75 mW to 1000 W, DC to 18 GHz

Product Flyer Version 10.00

ATTENUATORS

R&S®DNF

As a rule, the reflection coefficient of commercial signal generators or test receivers is about 20%. This value may be too high for precise measurements. To improve matching, an attenuator should be inserted after the signal generator output and another one ahead of the receiver input. This will reduce the reflection coefficients of both the generator and the receiver.

Signal generators often do not have a defined source impedance. In these cases, it is advisable to insert a 16 dB (10 dB + 6 dB) attenuator. The internal reflection coefficient of such a signal source is thus reduced to about 3%, which is small enough for accurate measurements.

Attenuators can also be used as reference standards for attenuation and gain measurements in line with the substitution method, for precise voltage division and as buffers to isolate test circuits.

R&S®DNF (1 W/2 W)

Small attenuation error, largely frequency-independent attenuation and low VSWR are special features of the R&S®DNF attenuators. They are sturdy, immune to vibration (in line with MIL-A-3933), only slightly temperature-dependent and resistant to short-term overloading. The R&S®DNF attenuators are equipped with N connectors (male, female) and are available with 3/6/10/20 dB attenuation.

R&S®DNF

HIGH-POWER ATTENUATORS

R&S®RBU, R&S®RDL

High-power attenuators are used as dummy loads for transmitters and amplifiers in the frequency range 0 Hz to 6 GHz. Their constant attenuation enables harmonics measurements on transmitters, TV transposers and other equipment.

The high-power attenuator is superior to a simple termination. The power applied can be accurately determined from the power measured at the test output and from the known attenuation. Moreover, a frequency counter or analyzer can be connected to the test output.

R&S®RDL50 (50 W)

The R&S®RDL50 high-power attenuator is suitable for the frequency range up to 6 GHz. A special feature is its constant low attenuation over the entire frequency range.

R&S®RBU (50 W/100 W)

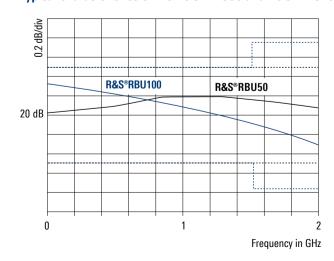

The R&S®RBU high-power attenuators with 3/6/10/20/30 dB attenuation are ideal for applications in the frequency range up to 2 GHz, which is of particular interest for mobile radio measurements. The attenuators are characterized by low VSWR and low attenuation error throughout the entire frequency range.

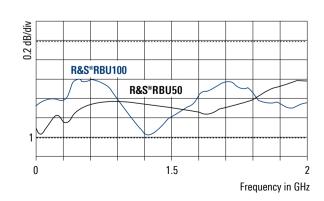

Due to the large heat sink, the attenuator surface temperature does not rise above +75°C (at +25°C ambient temperature) even under full load.

R&S®RDL50, 50 W

Typical characteristics of the R&S®RBU50 and R&S®RBU100 attenuators (20 dB attenuation)

TERMINATIONS

R&S®RNB, R&S®RAD, R&S®RAU

R&S®RNB (1 W)

The R&S®RNB 50 Ω termination is a versatile line termination used in type N coaxial line systems. A special feature is the very low reflection over a wide frequency range. The use of high-grade metal-film resistors provides a continuous power-handling capacity of 1 W.

The R&S®RNB termination is for general use in the frequency range from DC to 4 GHz.

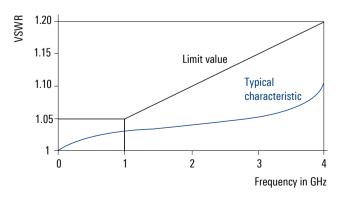

R&S®RAD (500 mW) and R&S®RAD50 (2 W) feedthrough terminations

The R&S°RAD feedthrough terminations are used for matching 50 Ω lines to test and measurement instruments with high input impedance (e.g. oscilloscopes or tuners with 1 M Ω input impedance). The feedthrough termination must be plugged directly onto the input connector of the instrument to ensure optimum matching.

R&S®RAU (100 W)

The R&S®RAU termination is mainly used as a dummy antenna for mobile and stationary transmitters. Its low VSWR makes it also suitable for TV equipment.

Limit value and typical VSWR characteristic of the R&S®RNB

MATCHING PADS

R&S®RAM, R&S®RAZ

For the precise measurement of insertion loss and phase shift, the signal generator, DUT and receiver must be well matched to one another. Matching pads allow systems of different characteristic impedance to be connected without costly retrofits.

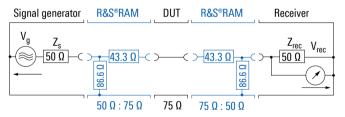

R&S®RAM and R&S®RAZ (2 W) matching pads

The bidirectional R&S®RAM matching pad provides the match between 50 Ω and 75 Ω impedance systems in both directions up to 2.7 GHz, causing minimum attenuation. Care should be taken that ports with the same characteristic impedances are connected to one another.

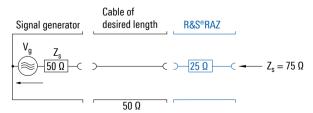

R&S®RAZ

R&S®RAM

Two R&S®RAM matching pads to match a 75 Ω DUT to a signal generator and receiver, each having a characteristic impedance of 50 $\Omega.$

R&S®RAZ

By connecting an R&S*RAZ matching pad consisting of a 25 Ω series resistor, a signal generator with a 50 Ω output has an output impedance of 75 Ω .

Voltage transformation is defined as the ratio in dB of the voltages at the connectors:

$$\mathcal{A}_{50\;\Omega\to75\;\Omega}=20\cdot\text{lg}\;\;\frac{\text{U}_{50\;\Omega}}{\text{U}_{75\;\Omega}}=4\;\text{dB}$$

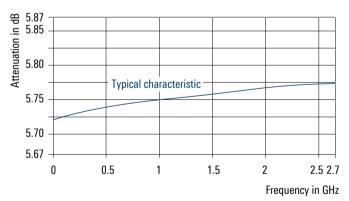

$$A_{75 \Omega \to 50 \Omega} = 20 \cdot \text{Ig} \ \frac{U_{75 \Omega}}{U_{50 \Omega}} = 7.5 \text{ dB}$$

Power attenuation is the same in both directions:

$$A_p = 10 \cdot \lg \frac{U_{75 \Omega}^2 \cdot 50 \Omega}{75 \Omega \cdot U_{50 \Omega}^2} = 5.72 \text{ dB}$$

The unidirectional R&S®RAZ matching pad is particularly suitable for the matching of signal generators. In most cases, signal and sweep generators have a source impedance of 50 Ω . They can be adapted to feed 75 Ω systems by means of the R&S®RAZ matching pad involving extremely low power loss. The output voltage displayed on the generator is also valid for the 75 Ω system and does not require correction.

Frequency response and error limits of power attenuation of the R&S®RAM matching pad

ULTRA BROADBAND LOAD

R&S®UBL100

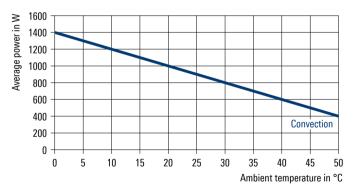

The R&S®UBL100 is an ultra broadband load that can be used from DC to 18 GHz.

The dummy load absorbs RF power and dissipates it through convection cooling. An optional fan unit improves heat dissipation. A built-in interlock loop can be used to switch off the device feeding the load when the heatsink temperature rises above +70 °C. Unlike cable loads, there is no lower frequency limit. The R&S°UBL100 can absorb up to 1800 W.

Maximum permissible average power as a function of ambient temperature

Maximum average power with convection cooling for +70 $^{\circ}$ C heatsink temperature

Key facts

- ► Very good return loss, especially up to 6 GHz
- ► High power capability
- ► Very rugged for short-term overload
- ► High crest factor capability
- ► Easy handling with optional caster wheels

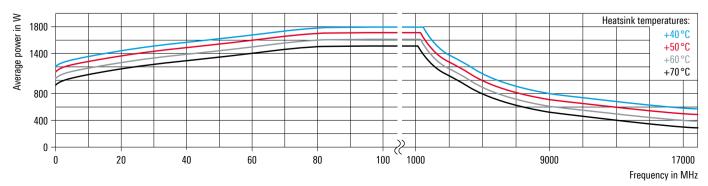

Power handling capability

The first diagram shows the derating of the load for convection cooling due to the limited ability of the heatsink to dissipate the absorbed energy for a given ambient temperature and maximum heatsink temperature of +70°C. The heatsink temperature reaches a stable value after more than one hour of continuous operation of the load.

The second diagram describes the maximum permissible input power in Watt due to the limits of the internal circuitry of the load. The derating is a function of the heatsink temperature. Between 80 MHz and 1000 MHz, the value for the maximum input power is constant. To prevent damage, the specified maximum average input power for a heatsink temperature of +70°C must not be exceeded.

When the optional fan unit is used, only the second diagram is relevant. In the case of convection cooling, both diagrams need to be taken into account, and the diagram giving the lower limit defines the maximum permissible input CW power for a certain frequency and ambient temperature.

Maximum permissible average power as a function of frequency and heatsink temperature

Specifications R&S®UBL100		
Frequency range		DC to 18 GHz
Input impedance		50 Ω
Input connector		4.3-10 female, adapter to N included
Input VSWR (including N adapter)	f ≤ 2 GHz	≤ 1.15
	2 GHz < f ≤ 6 GHz	≤ 1.25
	6 GHz < f ≤ 18 GHz	typ. ≤ 1.50,
		max. 2.25 possible at a few discrete frequencies
Average input power P _{avg} 1)	f ≤ 80 MHz	derating, see diagrams on page 8
	80 MHz < f ≤ 1.0 GHz	up to 1800 W with fan unit, see diagrams on page 8
	f > 1.0 GHz	derating, see diagrams on page 8
Crest factor for OFDM	bandwidth > 1 MHz	≤ 12 dB
Peak power (duty cycle < 1%)	$f \le 650$ MHz, $< 100 \mu s$ pulse width	≤ 15 kW
	f > 650 MHz, < 1 ms pulse width	≤ 15 kW
Maximum heatsink temperature	surface, near the interlock connector	≤ +70°C
Typical heatsink temperature T _{hs}	at +20°C ambient temperature and 1000 W average power	 +70°C for convection cooling, see user manual +33°C with optional fan unit, see user manual
Temperature protection		thermoswitch for external interlock loop, normally closed, opens at > +70°C
Interlock loop connector (thermoswitch)		D-Sub, 9-pin female, pin 1 and pin 5
Thermoswitch rating	voltage to ground, pin to pin	≤ 50 V
	current	≤ 1 A
Cooling		convection cooling, optional fan unit
General data		
Dimensions (W \times H \times D)	including handles and feet	492 mm \times 480 mm \times 198 mm (19.4 in \times 18.9 in \times 7.8 in)
Weight		45 kg (99.2 lb)
Fan unit		
Operating voltage range		85 V to 264 V AC, 47 Hz to 63 Hz
Rated current		≤ 0.9 A
Noise emission	in typical lab environment	approx. 77.5 dB(A)
Environmental conditions		
Temperature ranges		
Minimum operating temperature (ambient)	ultra broadband load and fan unit	+5°C
Maximum operating temperature (ambient)	ultra broadband load	see derating curve for average power versus ambient temperature on page 2
	fan unit	+45°C
Maximum operating temperature (air inlet)	fan unit	+60°C
Storage temperature range	ultra broadband load and fan unit	-40°C to +80°C
Damp heat	ultra broadband load	≤ 95% noncondensing
	fan unit	≤ 90% noncondensing
		ŭ
Operation above sea level	ultra broadband load and fan unit	2000 m

 $^{^{1)}}$ Depends on input power and exposure time; +70 °C surface temperature must not be exceeded.
