

EMC Standards - Overview 6.0

Rohde & Schwarz

EMC testing is all about standards. Whether you are developing 5G products, automotive equipment, military equipment or something as simple as a common table lamp, your device must meet requirements set by standardization bodies such as IEC, CISPR, ISO, IEEE, CENELEC, ETSI, FCC, ANSI, RTCA or the MIL-STD committee. Enforcement of strict EMC limits can delay product certification, leading to lost revenue, added cost, and redesign headaches.

The number of EMC standards published is steadily increasing. The different types of standards include basic standards, generic standards and product or product family standards.

Basic standards

Basic standards defining requirements on the measurement apparatus, measurement methods, measurement uncertainty and test facilities. These standards do not include limits. Therefore, they cannot be applied to a specific product or product family for testing. A basic standard come into force by a normative reference in the relevant test standard, e.g. the product standard CISPR 32 on emission measurements for multimedia equipment is referring to the basic standard CISPR 16-1-1 on the applicable measurement apparatus. Most test standards have dated references, that means a specific edition of the basic standard applies. However, if the reference is undated, the latest revision of the basic standards applies.

Generic standards

Generic standards apply for all cases for which no specific EMC standards yet exist. They are related to a specific operating environment They include EMC requirements and test procedures that are applicable to all products that would need to operate in the described environment. For example, IEC 61000-6-3 describes the required emission measurements for equipment to be used in residential environments.

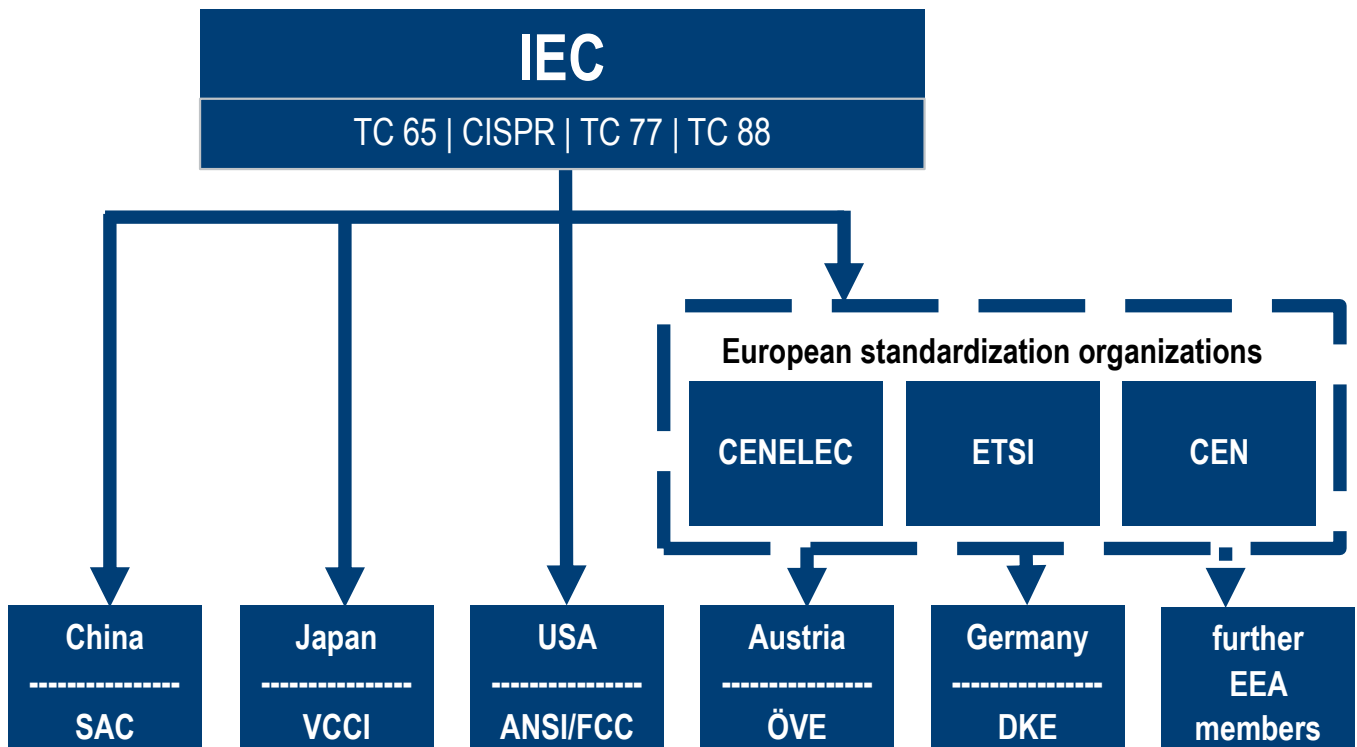

Product standards

Product family standards apply to specific products, or product families. They define the applicable measurement methods with corresponding EMC limits for the products that are within the scope of that standard. They also define product-specific requirements, such as operation and arrangement of the EUT.

The product (family) standards are divided into standards limiting low-frequency and high-frequency emission and standards defining the requirements of immunity to electromagnetic emission. Besides, there is a series of specific product standards defining EMC requirements.

International Electrotechnical Commission (IEC)

The IEC is an international standards organization that prepares and publishes standards for electrical, electronic and related technologies.

IEC standards on EMC are mostly part of the IEC 61000 family. With few exceptions IEC 61000 family is developed by IEC Technical Committee TC77.

European Committee for Electrotechnical Standardization

(CENELEC)

CENELEC produces standards for electrical engineering. Together with ETSI (Information and Communications Technologies) and CEN (other technical areas), it forms the European system for technical standardization.

EMC is a subject of national and international regulation. In Europe, it is regulated through the European Commission's **EMC Directive 2014/30/EU** and for radio equipment through **Radio Equipment Directive 2014/53/EU (RED)**. These directives are New Approach Directives. As such, they rely for their operation on Harmonised Standards developed by recognized European standards bodies, such as CEN, CENELEC and ETSI. Harmonised Standards define technical characteristics that can be used to demonstrate compliance with the essential requirements of the directive.

The summary below consolidates the references of Harmonised Standards published by the Commission in the Official Journal of the European Union (OJ) under **EMC Directive 2014/30/EU (as of 19 September 2022)**.

European Telecommunications Standards Institute (ETSI)

ETSI produces globally applicable standards for Information and Communications Technologies (ICT) enabled systems, applications and services. This includes fixed and mobile radio, broadcast and internet technologies.

EMC is a subject of national and international regulation. In Europe it is regulated through the European Commission's **EMC Directive 2014/30/EU** and for radio equipment through **Radio Equipment Directive 2014/53/EU (RED)**. These directives are New Approach Directives. As such, they rely for their operation on Harmonised Standards developed by recognized European standards bodies, such as CEN, CENELEC and ETSI. Harmonised Standards define technical characteristics that can be used to demonstrate compliance with the essential requirements of the directive.

The summary below consolidates the references of Harmonised Standards published by the Commission in the Official Journal of the European Union (OJ) under **Radio Equipment Directive 2014/53/EU (as of 10 November 2022)**.
