The software contained in this product makes use of several valuable open source software packages. For information, see the "Open Source Acknowledgment" on the user documentation CD-ROM (included in delivery).

Rohde & Schwarz would like to thank the open source community for their valuable contribution to embedded computing.
Basic Safety Instructions

Always read through and comply with the following safety instructions!

All plants and locations of the Rohde & Schwarz group of companies make every effort to keep the safety standards of our products up to date and to offer our customers the highest possible degree of safety. Our products and the auxiliary equipment they require are designed, built and tested in accordance with the safety standards that apply in each case. Compliance with these standards is continuously monitored by our quality assurance system. The product described here has been designed, built and tested in accordance with the EC Certificate of Conformity and has left the manufacturer’s plant in a condition fully complying with safety standards. To maintain this condition and to ensure safe operation, you must observe all instructions and warnings provided in this manual. If you have any questions regarding these safety instructions, the Rohde & Schwarz group of companies will be happy to answer them.

Furthermore, it is your responsibility to use the product in an appropriate manner. This product is designed for use solely in industrial and laboratory environments or, if expressly permitted, also in the field and must not be used in any way that may cause personal injury or property damage. You are responsible if the product is used for any purpose other than its designated purpose or in disregard of the manufacturer’s instructions. The manufacturer shall assume no responsibility for such use of the product.

The product is used for its designated purpose if it is used in accordance with its product documentation and within its performance limits (see data sheet, documentation, the following safety instructions). Using the product requires technical skills and, in some cases, a basic knowledge of English. It is therefore essential that only skilled and specialized staff or thoroughly trained personnel with the required skills be allowed to use the product. If personal safety gear is required for using Rohde & Schwarz products, this will be indicated at the appropriate place in the product documentation. Keep the basic safety instructions and the product documentation in a safe place and pass them on to the subsequent users.

Observing the safety instructions will help prevent personal injury or damage of any kind caused by dangerous situations. Therefore, carefully read through and adhere to the following safety instructions before and when using the product. It is also absolutely essential to observe the additional safety instructions on personal safety, for example, that appear in relevant parts of the product documentation. In these safety instructions, the word “product” refers to all merchandise sold and distributed by the Rohde & Schwarz group of companies, including instruments, systems and all accessories. For product-specific information, see the data sheet and the product documentation.

Safety labels on products

The following safety labels are used on products to warn against risks and dangers.

<table>

### Signal words and their meaning

The following signal words are used in the product documentation in order to warn the reader about risks and dangers.

- **DANGER**: Indicates a hazardous situation which, if not avoided, will result in death or serious injury.
- **WARNING**: Indicates a hazardous situation which, if not avoided, could result in death or serious injury.
- **CAUTION**: Indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.
- **NOTICE**: Indicates information considered important, but not hazard-related, e.g. messages relating to property damage.

In the product documentation, the word ATTENTION is used synonymously.

These signal words are in accordance with the standard definition for civil applications in the European Economic Area. Definitions that deviate from the standard definition may also exist in other economic areas or military applications. It is therefore essential to make sure that the signal words described here are always used only in connection with the related product documentation and the related product. The use of signal words in connection with unrelated products or documentation can result in misinterpretation and in personal injury or material damage.
Basic Safety Instructions

Operating states and operating positions

The product may be operated only under the operating conditions and in the positions specified by the manufacturer, without the product's ventilation being obstructed. If the manufacturer's specifications are not observed, this can result in electric shock, fire and/or serious personal injury or death. Applicable local or national safety regulations and rules for the prevention of accidents must be observed in all work performed.

1. Unless otherwise specified, the following requirements apply to Rohde & Schwarz products: predefined operating position is always with the housing floor facing down, IP protection 2X, use only indoors, max. operating altitude 2000 m above sea level, max. transport altitude 4500 m above sea level. A tolerance of ±10 % shall apply to the nominal voltage and ±5 % to the nominal frequency, overvoltage category 2, pollution degree 2.

2. Do not place the product on surfaces, vehicles, cabinets or tables that for reasons of weight or stability are unsuitable for this purpose. Always follow the manufacturer's installation instructions when installing the product and fastening it to objects or structures (e.g. walls and shelves). An installation that is not carried out as described in the product documentation could result in personal injury or even death.

3. Do not place the product on heat-generating devices such as radiators or fan heaters. The ambient temperature must not exceed the maximum temperature specified in the product documentation or in the data sheet. Product overheating can cause electric shock, fire and/or serious personal injury or even death.

Electrical safety

If the information on electrical safety is not observed either at all or to the extent necessary, electric shock, fire and/or serious personal injury or death may occur.

1. Prior to switching on the product, always ensure that the nominal voltage setting on the product matches the nominal voltage of the mains-supply network. If a different voltage is to be set, the power fuse of the product may have to be changed accordingly.

2. In the case of products of safety class I with movable power cord and connector, operation is permitted only on sockets with a protective conductor contact and protective conductor.

3. Intentionally breaking the protective conductor either in the feed line or in the product itself is not permitted. Doing so can result in the danger of an electric shock from the product. If extension cords or connector strips are implemented, they must be checked on a regular basis to ensure that they are safe to use.

4. If there is no power switch for disconnecting the product from the mains, or if the power switch is not suitable for this purpose, use the plug of the connecting cable to disconnect the product from the mains. In such cases, always ensure that the power plug is easily reachable and accessible at all times. For example, if the power plug is the disconnecting device, the length of the connecting cable must not exceed 3 m. Functional or electronic switches are not suitable for providing disconnection from the AC supply network. If products without power switches are integrated into racks or systems, the disconnecting device must be provided at the system level.

5. Never use the product if the power cable is damaged. Check the power cables on a regular basis to ensure that they are in proper operating condition. By taking appropriate safety measures and carefully laying the power cable, ensure that the cable cannot be damaged and that no one can be hurt by, for example, tripping over the cable or suffering an electric shock.
Basic Safety Instructions

6. The product may be operated only from TN/TT supply networks fuse-protected with max. 16 A (higher fuse only after consulting with the Rohde & Schwarz group of companies).

7. Do not insert the plug into sockets that are dusty or dirty. Insert the plug firmly and all the way into the socket provided for this purpose. Otherwise, sparks that result in fire and/or injuries may occur.

8. Do not overload any sockets, extension cords or connector strips; doing so can cause fire or electric shocks.

9. For measurements in circuits with voltages $V_{\text{rms}} > 30$ V, suitable measures (e.g. appropriate measuring equipment, fuse protection, current limiting, electrical separation, insulation) should be taken to avoid any hazards.

10. Ensure that the connections with information technology equipment, e.g. PCs or other industrial computers, comply with the IEC 60950-1 / EN 60950-1 or IEC 61010-1 / EN 61010-1 standards that apply in each case.

11. Unless expressly permitted, never remove the cover or any part of the housing while the product is in operation. Doing so will expose circuits and components and can lead to injuries, fire or damage to the product.

12. If a product is to be permanently installed, the connection between the protective conductor terminal on site and the product's protective conductor must be made first before any other connection is made. The product may be installed and connected only by a licensed electrician.

13. For permanently installed equipment without built-in fuses, circuit breakers or similar protective devices, the supply circuit must be fuse-protected in such a way that anyone who has access to the product, as well as the product itself, is adequately protected from injury or damage.

14. Use suitable overvoltage protection to ensure that no overvoltage (such as that caused by a bolt of lightning) can reach the product. Otherwise, the person operating the product will be exposed to the danger of an electric shock.

15. Any object that is not designed to be placed in the openings of the housing must not be used for this purpose. Doing so can cause short circuits inside the product and/or electric shocks, fire or injuries.

16. Unless specified otherwise, products are not liquid-proof (see also section "Operating states and operating positions", item 1). Therefore, the equipment must be protected against penetration by liquids. If the necessary precautions are not taken, the user may suffer electric shock or the product itself may be damaged, which can also lead to personal injury.

17. Never use the product under conditions in which condensation has formed or can form in or on the product, e.g. if the product has been moved from a cold to a warm environment. Penetration by water increases the risk of electric shock.

18. Prior to cleaning the product, disconnect it completely from the power supply (e.g. AC supply network or battery). Use a soft, non-linting cloth to clean the product. Never use chemical cleaning agents such as alcohol, acetone or diluents for cellulose lacquers.

Operation

1. Operating the products requires special training and intense concentration. Make sure that persons who use the products are physically, mentally and emotionally fit enough to do so; otherwise, injuries or material damage may occur. It is the responsibility of the employer/operator to select suitable personnel for operating the products.
Basic Safety Instructions

2. Before you move or transport the product, read and observe the section titled "Transport".

3. As with all industrially manufactured goods, the use of substances that induce an allergic reaction (allergens) such as nickel cannot be generally excluded. If you develop an allergic reaction (such as a skin rash, frequent sneezing, red eyes or respiratory difficulties) when using a Rohde & Schwarz product, consult a physician immediately to determine the cause and to prevent health problems or stress.

4. Before you start processing the product mechanically and/or thermally, or before you take it apart, be sure to read and pay special attention to the section titled "Waste disposal/Environmental protection", item 1.

5. Depending on the function, certain products such as RF radio equipment can produce an elevated level of electromagnetic radiation. Considering that unborn babies require increased protection, pregnant women must be protected by appropriate measures. Persons with pacemakers may also be exposed to risks from electromagnetic radiation. The employer/operator must evaluate workplaces where there is a special risk of exposure to radiation and, if necessary, take measures to avert the potential danger.

6. Should a fire occur, the product may release hazardous substances (gases, fluids, etc.) that can cause health problems. Therefore, suitable measures must be taken, e.g. protective masks and protective clothing must be worn.

7. Laser products are given warning labels that are standardized according to their laser class. Lasers can cause biological harm due to the properties of their radiation and due to their extremely concentrated electromagnetic power. If a laser product (e.g. a CD/DVD drive) is integrated into a Rohde & Schwarz product, absolutely no other settings or functions may be used as described in the product documentation. The objective is to prevent personal injury (e.g. due to laser beams).

8. EMC classes (in line with EN 55011/CISPR 11, and analogously with EN 55022/CISPR 22, EN 55032/CISPR 32)
   - Class A equipment:
     Equipment suitable for use in all environments except residential environments and environments that are directly connected to a low-voltage supply network that supplies residential buildings
     Note: Class A equipment is intended for use in an industrial environment. This equipment may cause radio disturbances in residential environments, due to possible conducted as well as radiated disturbances. In this case, the operator may be required to take appropriate measures to eliminate these disturbances.
   - Class B equipment:
     Equipment suitable for use in residential environments and environments that are directly connected to a low-voltage supply network that supplies residential buildings

Repair and service

1. The product may be opened only by authorized, specially trained personnel. Before any work is performed on the product or before the product is opened, it must be disconnected from the AC supply network. Otherwise, personnel will be exposed to the risk of an electric shock.
Basic Safety Instructions

2. Adjustments, replacement of parts, maintenance and repair may be performed only by electrical experts authorized by Rohde & Schwarz. Only original parts may be used for replacing parts relevant to safety (e.g. power switches, power transformers, fuses). A safety test must always be performed after parts relevant to safety have been replaced (visual inspection, protective conductor test, insulation resistance measurement, leakage current measurement, functional test). This helps ensure the continued safety of the product.

Batteries and rechargeable batteries/cells

If the information regarding batteries and rechargeable batteries/cells is not observed either at all or to the extent necessary, product users may be exposed to the risk of explosions, fire and/or serious personal injury, and, in some cases, death. Batteries and rechargeable batteries with alkaline electrolytes (e.g. lithium cells) must be handled in accordance with the EN 62133 standard.

1. Cells must not be taken apart or crushed.

2. Cells or batteries must not be exposed to heat or fire. Storage in direct sunlight must be avoided. Keep cells and batteries clean and dry. Clean soiled connectors using a dry, clean cloth.

3. Cells or batteries must not be short-circuited. Cells or batteries must not be stored in a box or in a drawer where they can short-circuit each other, or where they can be short-circuited by other conductive materials. Cells and batteries must not be removed from their original packaging until they are ready to be used.

4. Cells and batteries must not be exposed to any mechanical shocks that are stronger than permitted.

5. If a cell develops a leak, the fluid must not be allowed to come into contact with the skin or eyes. If contact occurs, wash the affected area with plenty of water and seek medical aid.

6. Improperly replacing or charging cells or batteries that contain alkaline electrolytes (e.g. lithium cells) can cause explosions. Replace cells or batteries only with the matching Rohde & Schwarz type (see parts list) in order to ensure the safety of the product.

7. Cells and batteries must be recycled and kept separate from residual waste. Rechargeable batteries and normal batteries that contain lead, mercury or cadmium are hazardous waste. Observe the national regulations regarding waste disposal and recycling.

Transport

1. The product may be very heavy. Therefore, the product must be handled with care. In some cases, the user may require a suitable means of lifting or moving the product (e.g. with a lift-truck) to avoid back or other physical injuries.

2. Handles on the products are designed exclusively to enable personnel to transport the product. It is therefore not permissible to use handles to fasten the product to or on transport equipment such as cranes, fork lifts, wagons, etc. The user is responsible for securely fastening the products to or on the means of transport or lifting. Observe the safety regulations of the manufacturer of the means of transport or lifting. Noncompliance can result in personal injury or material damage.

3. If you use the product in a vehicle, it is the sole responsibility of the driver to drive the vehicle safely and properly. The manufacturer assumes no responsibility for accidents or collisions. Never use the product in a moving vehicle if doing so could distract the driver of the vehicle. Adequately secure the product in the vehicle to prevent injuries or other damage in the event of an accident.
Waste disposal/Environmental protection

1. Specially marked equipment has a battery or accumulator that must not be disposed of with unsorted municipal waste, but must be collected separately. It may only be disposed of at a suitable collection point or via a Rohde & Schwarz customer service center.

2. Waste electrical and electronic equipment must not be disposed of with unsorted municipal waste, but must be collected separately.
Rohde & Schwarz GmbH & Co. KG has developed a disposal concept and takes full responsibility for take-back obligations and disposal obligations for manufacturers within the EU. Contact your Rohde & Schwarz customer service center for environmentally responsible disposal of the product.

3. If products or their components are mechanically and/or thermally processed in a manner that goes beyond their intended use, hazardous substances (heavy-metal dust such as lead, beryllium, nickel) may be released. For this reason, the product may only be disassembled by specially trained personnel. Improper disassembly may be hazardous to your health. National waste disposal regulations must be observed.

4. If handling the product releases hazardous substances or fuels that must be disposed of in a special way, e.g. coolants or engine oils that must be replenished regularly, the safety instructions of the manufacturer of the hazardous substances or fuels and the applicable regional waste disposal regulations must be observed. Also observe the relevant safety instructions in the product documentation. The improper disposal of hazardous substances or fuels can cause health problems and lead to environmental damage.

For additional information about environmental protection, visit the Rohde & Schwarz website.

Instrucciones de seguridad elementales

¡Es imprescindible leer y cumplir las siguientes instrucciones e informaciones de seguridad!

El principio del grupo de empresas Rohde & Schwarz consiste en tener nuestros productos siempre al día con los estándares de seguridad y de ofrecer a nuestros clientes el máximo grado de seguridad. Nuestros productos y todos los equipos adicionales son siempre fabricados y examinados según las normas de seguridad vigentes. Nuestro sistema de garantía de calidad controla constantemente que sean cumplidas estas normas. El presente producto ha sido fabricado y examinado según el certificado de conformidad de la UE y ha salido de nuestra planta en estado impecable según los estándares técnicos de seguridad. Para poder preservar este estado y garantizar un funcionamiento libre de peligros, el usuario deberá atenerse a todas las indicaciones, informaciones de seguridad y notas de alerta. El grupo de empresas Rohde & Schwarz está siempre a su disposición en caso de que tengan preguntas referentes a estas informaciones de seguridad.

Además queda en la responsabilidad del usuario utilizar el producto en la forma debida. Este producto está destinado exclusivamente al uso en la industria y el laboratorio o, si ha sido expresamente autorizado, para aplicaciones de campo y de ninguna manera deberá ser utilizado de modo que alguna persona/cosa pueda sufrir daño. El uso del producto fuera de sus fines definidos o sin tener en cuenta las instrucciones del fabricante queda en la responsabilidad del usuario. El fabricante no se hace en ninguna forma responsable de consecuencias a causa del mal uso del producto.
Instrucciones de seguridad elementales

Se parte del uso correcto del producto para los fines definidos si el producto es utilizado conforme a las indicaciones de la correspondiente documentación del producto y dentro del margen de rendimiento definido (ver hoja de datos, documentación, informaciones de seguridad que siguen). El uso del producto hace necesarios conocimientos técnicos y ciertos conocimientos del idioma inglés. Por eso se debe tener en cuenta que el producto solo pueda ser operado por personal especializado o personas instruidas en profundidad con las capacidades correspondientes. Si fuera necesaria inductaria de seguridad para el uso de productos de Rohde & Schwarz, encontraría la información debida en la documentación del producto en el capítulo correspondiente. Guarde bien las informaciones de seguridad elementales, así como la documentación del producto, y entréguelas a usuarios posteriores.

Tener en cuenta las informaciones de seguridad sirve para evitar en lo posible lesiones o daños por peligros de toda clase. Por eso es imprescindible leer detalladamente y comprender por completo las siguientes informaciones de seguridad antes de usar el producto, y respetarlas durante el uso del producto. Deberán tenerse en cuenta todas las demás informaciones de seguridad, como p. ej. las referentes a la protección de personas, que encontrarán en el capítulo correspondiente de la documentación del producto y que también son de obligado cumplimiento. En las presentes informaciones de seguridad se recogen todos los objetos que distribuye el grupo de empresas Rohde & Schwarz bajo la denominación de "producto", entre ellos también aparatos, instalaciones así como toda clase de accesorios. Los datos específicos del producto figuran en la hoja de datos y en la documentación del producto.

Señalización de seguridad de los productos

Las siguientes señales de seguridad se utilizan en los productos para advertir sobre riesgos y peligros.

Palabras de señal y su significado
En la documentación del producto se utilizan las siguientes palabras de señal con el fin de advertir contra riesgos y peligros.

![PELIGRO](image) Indica una situación de peligro que, si no se evita, causa lesiones graves o incluso la muerte.

![ADVERTENCIA](image) Indica una situación de peligro que, si no se evita, puede causar lesiones graves o incluso la muerte.

![ATENCIÓN](image) Indica una situación de peligro que, si no se evita, puede causar lesiones leves o moderadas.

![AVISO](image) Indica información que se considera importante, pero no en relación con situaciones de peligro; p. ej., avisos sobre posibles daños materiales.

En la documentación del producto se emplea de forma sinónima el término CUIDADO.

Las palabras de señal corresponden a la definición habitual para aplicaciones civiles en el área económica europea. Pueden existir definiciones diferentes a esta definición en otras áreas económicas o en aplicaciones militares. Por eso se deberá tener en cuenta que las palabras de señal aquí descritas sean utilizadas siempre solamente en combinación con la correspondiente documentación del producto y solamente en combinación con el producto correspondiente. La utilización de las palabras de señal en combinación con productos o documentaciones que no les correspondan puede llevar a interpretaciones equivocadas y tener por consecuencia daños en personas u objetos.

Estados operativos y posiciones de funcionamiento
El producto solamente debe ser utilizado según lo indicado por el fabricante respecto a los estados operativos y posiciones de funcionamiento sin que se obstruya la ventilación. Si no se siguen las indicaciones del fabricante, pueden producirse choques eléctricos, incendios y/o lesiones graves con posible consecuencia de muerte. En todos los trabajos deberán ser tenidas en cuenta las normas nacionales y locales de seguridad del trabajo y de prevención de accidentes.
Instrucciones de seguridad elementales

1. Si no se convino de otra manera, es para los productos Rohde & Schwarz válido lo que sigue: como posición de funcionamiento se define por principio la posición con el suelo de la caja para abajo, modo de protección IP 2X, uso solamente en estancias interiores, utilización hasta 2000 m sobre el nivel del mar, transporte hasta 4500 m sobre el nivel del mar. Se aplicará una tolerancia de ±10 % sobre el voltaje nominal y de ±5 % sobre la frecuencia nominal. Categoría de sobrecarga eléctrica 2, índice de suciedad 2.

2. No sitúe el producto encima de superficies, vehículos, estantes o mesas, que por sus características de peso o de estabilidad no sean aptos para él. Siga siempre las instrucciones de instalación del fabricante cuando instale y asegure el producto en objetos o estructuras (p. ej. paredes y estantes). Si se realiza la instalación de modo distinto al indicado en la documentación del producto, se pueden causar lesiones o, en determinadas circunstancias, incluso la muerte.

3. No ponga el producto sobre aparatos que generen calor (p. ej. radiadores o calefactores). La temperatura ambiente no debe superar la temperatura máxima especificada en la documentación del producto o en la hoja de datos. En caso de sobrecalentamiento del producto, pueden producirse choques eléctricos, incendios y/o lesiones graves con posible consecuencia de muerte.

Seguridad eléctrica

Si no se siguen (o se siguen de modo insuficiente) las indicaciones del fabricante en cuanto a seguridad eléctrica, pueden producirse choques eléctricos, incendios y/o lesiones graves con posible consecuencia de muerte.

1. Antes de la puesta en marcha del producto se deberá comprobar siempre que la tensión preseleccionada en el producto coincida con la de la red de alimentación eléctrica. Si es necesario modificar el ajuste de tensión, también se deberán cambiar en caso dado los fusibles correspondientes del producto.

2. Los productos de la clase de protección I con alimentación móvil y enchufe individual solamente podrán enchufarse a tomas de corriente con contacto de seguridad y con conductor de protección conectado.

3. Queda prohibida la interrupción intencionada del conductor de protección, tanto en la toma de corriente como en el mismo producto. La interrupción puede tener como consecuencia el riesgo de que el producto sea fuente de choques eléctricos. Si se utilizan cables alargadores o regletas de enchufe, deberá garantizarse la realización de un examen regular de los mismos en cuanto a su estado técnico de seguridad.

4. Si el producto no está equipado con un interruptor para desconectarlo de la red, o bien si el interruptor existente no resulta apropiado para la desconexión de la red, el enchufe del cable de conexión se deberá considerar como un dispositivo de desconexión. El dispositivo de desconexión se debe poder alcanzar fácilmente y debe estar siempre bien accesible. Sí, p. ej., el enchufe de conexión a la red es el dispositivo de desconexión, la longitud del cable de conexión no debe superar 3 m). Los interruptores selectores o electrónicos no son aptos para el corte de la red eléctrica. Si se integran productos sin interruptor en bastidores o instalaciones, se deberá colocar el interruptor en el nivel de la instalación.

5. No utilice nunca el producto si está dañado el cable de conexión a red. Compruebe regularmente el correcto estado de los cables de conexión a red. Asegúrese, mediante las medidas de protección y de instalación adecuadas, de que el cable de conexión a red no pueda ser dañado o de que nadie pueda ser dañado por él, p. ej. al tropezar o por un choque eléctrico.
Instrucciones de seguridad elementales

6. Solamente está permitido el funcionamiento en redes de alimentación TN/TT aseguradas con fusibles de 16 A como máximo (utilización de fusibles de mayor amperaje solo previa consulta con el grupo de empresas Rohde & Schwarz).

7. Nunca conecte el enchufe en tomas de corriente sucias o llenas de polvo. Introduzca el enchufe por completo y fuertemente en la toma de corriente. La no observación de estas medidas puede provocar chispas, fuego y/o lesiones.

8. No sobrecargue las tomas de corriente, los cables alargadores o las regletas de enchufe ya que esto podría causar fuego o choques eléctricos.

9. En las mediciones en circuitos de corriente con una tensión $U_{\text{eff}} > 30$ V se deberán tomar las medidas apropiadas para impedir cualquier peligro (p. ej. medios de medición adecuados, seguros, limitación de tensión, corte protector, aislamiento etc.).

10. Para la conexión con dispositivos informáticos como un PC o un ordenador industrial, debe comprobarse que éstos cumplan los estándares IEC60950-1/EN60950-1 o IEC61010-1/EN 61010-1 válidos en cada caso.

11. A menos que esté permitido expresamente, no retire nunca la tapa ni componentes de la carcasa mientras el producto esté en servicio. Esto pone a descubierto los cables y componentes eléctricos y puede causar lesiones, fuego o daños en el producto.

12. Si un producto se instala en un lugar fijo, se deberá primero conectar el conductor de protección fijo con el conductor de protección del producto antes de hacer cualquier otra conexión. La instalación y la conexión deberán ser efectuadas por un electricista especializado.

13. En el caso de dispositivos fijos que no estén provistos de fusibles, interruptor automático ni otros mecanismos de seguridad similares, el circuito de alimentación debe estar protegido de modo que todas las personas que puedan acceder al producto, así como el producto mismo, estén a salvo de posibles daños.

14. Todo producto debe estar protegido contra sobretensión (debida p. ej. a una caída del rayo) mediante los correspondientes sistemas de protección. Si no, el personal que lo utilice quedará expuesto al peligro de choque eléctrico.

15. No debe introducirse en los orificios de la caja del aparato ningún objeto que no esté destinado a ello. Esto puede producir cortocircuitos en el producto y/o puede causar choques eléctricos, fuego o lesiones.

16. Salvo indicación contraria, los productos no están impermeabilizados (ver también el capítulo "Estados operativos y posiciones de funcionamiento", punto 1). Por eso es necesario tomar las medidas necesarias para evitar la entrada de líquidos. En caso contrario, existe peligro de choque eléctrico para el usuario o de daños en el producto, que también pueden redundar en peligro para las personas.

17. No utilice el producto en condiciones en las que pueda producirse o ya se hayan producido condensaciones sobre el producto o en el interior de éste, como p. ej. al desplazarlo de un lugar frío a otro caliente. La entrada de agua aumenta el riesgo de choque eléctrico.

18. Antes de la limpieza, desconecte por completo el producto de la alimentación de tensión (p. ej. red de alimentación o batería). Realice la limpieza de los aparatos con un paño suave, que no se deshilache. No utilice bajo ningún concepto productos de limpieza químicos como alcohol, acetona o diluyentes para lacas nitrocelulósicas.
Instrucciones de seguridad elementales

Funcionamiento

1. El uso del producto requiere instrucciones especiales y una alta concentración durante el manejo. Debe asegurarse que las personas que manején el producto estén a la altura de los requerimientos necesarios en cuanto a aptitudes físicas, psíquicas y emocionales, ya que de otra manera no se pueden excluir lesiones o daños de objetos. El empresario u operador es responsable de seleccionar el personal usuario apto para el manejo del producto.

2. Antes de desplazar o transportar el producto, lea y tenga en cuenta el capítulo "Transporte".

3. Como con todo producto de fabricación industrial no puede quedar excluida en general la posibilidad de que se produzcan alergias provocadas por algunos materiales empleados —los llamados alérgenos (p. ej. el níquel)—. Si durante el manejo de productos Rohde & Schwarz se producen reacciones alérgicas, como p. ej. irritaciones cutáneas, estornudos continuos, enrojecimiento de la conjuntiva o dificultades respiratorias, debe avisarse inmediatamente a un médico para investigar las causas y evitar cualquier molestia o daño a la salud.

4. Antes de la manipulación mecánica y/o térmica o el desmontaje del producto, debe tenerse en cuenta imprescindiblemente el capítulo "Eliminación/protexción del medio ambiente", punto 1.

5. Ciertos productos, como p. ej. las instalaciones de radiocomunicación RF, pueden a causa de su función natural, emitir una radiación electromagnética aumentada. Deben tomarse todas las medidas necesarias para la protección de las mujeres embarazadas. También las personas con marcapasos pueden correr peligro a causa de la radiación electromagnética. El empresario/operador tiene la obligación de evaluar y señalar las áreas de trabajo en las que exista un riesgo elevado de exposición a radiaciones.

6. Tenga en cuenta que en caso de incendio pueden desprenderse del producto sustancias tóxicas (gases, líquidos etc.) que pueden generar daños a la salud. Por eso, en caso de incendio deben usarse medidas adecuadas, como p. ej. máscaras antigás e indumentaria de protección.

7. Los productos con láser están provistos de indicaciones de advertencia normalizadas en función de la clase de láser del que se trate. Los rayos láser pueden provocar daños de tipo biológico a causa de las propiedades de su radiación y debido a su concentración extrema de potencia electromagnética. En caso de que un producto Rohde & Schwarz contenga un producto láser (p. ej. un lector de CD/DVD), no debe usarse ninguna otra configuración o función aparte de las descritas en la documentación del producto, a fin de evitar lesiones (p. ej. debidas a irradiación láser).

8. Clases de compatibilidad electromagnética (conforme a EN 55011 / CISPR 11; y en analogía con EN 55022 / CISPR 22, EN 55032 / CISPR 32)
   - Aparato de clase A:
     Aparato adecuado para su uso en todos los entornos excepto en los residenciales y en aquellos conectados directamente a una red de distribución de baja tensión que suministra corriente a edificios residenciales.
     Nota: Los aparatos de clase A están destinados al uso en entornos industriales. Estos aparatos pueden causar perturbaciones radioeléctricas en entornos residenciales debido a posibles perturbaciones guiadas o radiadas. En este caso, se le podrá solicitar al operador que tome las medidas adecuadas para eliminar estas perturbaciones.
   - Aparato de clase B:
     Aparato adecuado para su uso en entornos residenciales, así como en aquellos conectados directamente a una red de distribución de baja tensión que suministra corriente a edificios residenciales.
Instrucciones de seguridad elementales

Reparación y mantenimiento

1. El producto solamente debe ser abierto por personal especializado con autorización para ello. Antes de manipular el producto o abrirlo, es obligatorio desconectarlo de la tensión de alimentación, para evitar toda posibilidad de choque eléctrico.

2. El ajuste, el cambio de partes, el mantenimiento y la reparación deberán ser efectuadas solamente por electricistas autorizados por Rohde & Schwarz. Si se reponen partes con importancia para los aspectos de seguridad (p. ej. el enchufe, los transformadores o los fusibles), solamente podrán ser sustituidos por partes originales. Después de cada cambio de partes relevantes para la seguridad deberá realizarse un control de seguridad (control a primera vista, control del conductor de protección, medición de resistencia de aislamiento, medición de la corriente de fuga, control de funcionamiento). Con esto queda garantizada la seguridad del producto.

Baterías y acumuladores o celdas

Si no se siguen (o se siguen de modo insuficiente) las indicaciones en cuanto a las baterías y acumuladores o celdas, pueden producirse explosiones, incendios y/o lesiones graves con posible consecuencia de muerte. El manejo de baterías y acumuladores con electrolitos alcalinos (p. ej. celdas de litio) debe seguir el estándar EN 62133.

1. No deben desmontarse, abrirse ni triturarse las celdas.

2. Las celdas o baterías no deben someterse a calor ni fuego. Debe evitarse el almacenamiento a la luz directa del sol. Las celdas y baterías deben mantenerse limpias y secas. Limpiar las conexiones sucias con un paño seco y limpio.

3. Las celdas o baterías no deben cortocircuitarse. Es peligroso almacenar las celdas o baterías en estuches o cajones en cuyo interior puedan cortocircuitarse por contacto recíproco o por contacto con otros materiales conductores. No deben extraerse las celdas o baterías de sus embalajes originales hasta el momento en que vayan a utilizarse.

4. Las celdas o baterías no deben someterse a impactos mecánicos fuertes indebidos.

5. En caso de falta de estanqueidad de una celda, el líquido vertido no debe entrar en contacto con la piel ni los ojos. Si se produce contacto, lavar con agua abundante la zona afectada y avisar a un médico.

6. En caso de cambio o recarga inadecuados, las celdas o baterías que contienen electrolitos alcalinos (p. ej. las celdas de litio) pueden explotar. Para garantizar la seguridad del producto, las celdas o baterías solo deben ser sustituidas por el tipo Rohde & Schwarz correspondiente (ver lista de recambios).

7. Las baterías y celdas deben reciclarse y no deben tirarse a la basura doméstica. Las baterías o acumuladores que contienen plomo, mercurio o cadmio deben tratarse como residuos especiales. Respete en esta relación las normas nacionales de eliminación y reciclaje.

Transporte

1. El producto puede tener un peso elevado. Por eso es necesario desplazarlo o transportarlo con precaución y, si es necesario, usando un sistema de elevación adecuado (p. ej. una carretilla elevadora), a fin de evitar lesiones en la espalda u otros daños personales.
Instrucciones de seguridad elementales

2. Las asas instaladas en los productos sirven solamente de ayuda para el transporte del producto por personas. Por eso no está permitido utilizar las asas para la sujeción en o sobre medios de transporte como p. ej. grúas, carretillas elevadoras de horquilla, carros etc. Es responsabilidad suya fijar los productos de manera segura a los medios de transporte o elevación. Para evitar daños personales o daños en el producto, siga las instrucciones de seguridad del fabricante del medio de transporte o elevación utilizado.

3. Si se utiliza el producto dentro de un vehículo, recae de manera exclusiva en el conductor la responsabilidad de conducir el vehículo de manera segura y adecuada. El fabricante no asumirá ninguna responsabilidad por accidentes o colisiones. No utilice nunca el producto dentro de un vehículo en movimiento si esto pudiera distraer al conductor. Asegure el producto dentro del vehículo debidamente para evitar, en caso de un accidente, lesiones u otra clase de daños.

Eliminación/protección del medio ambiente

1. Los dispositivos marcados contienen una batería o un acumulador que no se debe desechar con los residuos domésticos sin clasificar, sino que debe ser recogido por separado. La eliminación se debe efectuar exclusivamente a través de un punto de recogida apropiado o del servicio de atención al cliente de Rohde & Schwarz.

2. Los dispositivos eléctricos usados no se deben desechar con los residuos domésticos sin clasificar, sino que deben ser recogidos por separado. Rohde & Schwarz GmbH & Co.KG ha elaborado un concepto de eliminación de residuos y asume plenamente los deberes de recogida y eliminación para los fabricantes dentro de la UE. Para desechar el producto de manera respetuosa con el medio ambiente, diríjase a su servicio de atención al cliente de Rohde & Schwarz.

3. Si se trabaja de manera mecánica y/o térmica cualquier producto o componente más allá del funcionamiento previsto, pueden liberarse sustancias peligrosas (polvos con contenido de metales pesados como p. ej. plomo, berilio o níquel). Por eso el producto solo debe ser desmontado por personal especializado con formación adecuada. Un desmontaje inadecuado puede ocasionar daños para la salud. Se deben tener en cuenta las directivas nacionales referentes a la eliminación de residuos.

4. En caso de que durante el trato del producto se formen sustancias peligrosas o combustibles que deban tratarse como residuos especiales (p. ej. refrigerantes o aceites de motor con intervalos de cambio definidos), deben tenerse en cuenta las indicaciones de seguridad del fabricante de dichas sustancias y las normas regionales de eliminación de residuos. Tenga en cuenta también en caso necesario las indicaciones de seguridad especiales contenidas en la documentación del producto. La eliminación incorrecta de sustancias peligrosas o combustibles puede causar daños a la salud o daños al medio ambiente.

Se puede encontrar más información sobre la protección del medio ambiente en la página web de Rohde & Schwarz.
Quality management and environmental management

Sehr geehrter Kunde,

Der Umwelt verpflichtet
- Energie-effiziente, RoHS-konforme Produkte
- Kontinuierliche Weiterentwicklung nachhaltiger Umweltkonzepte
- ISO 14001-zertifiziertes Umweltmanagementsystem

Dear customer,
You have decided to buy a Rohde & Schwarz product. This product has been manufactured using the most advanced methods. It was developed, manufactured and tested in compliance with our quality management and environmental management systems. Rohde & Schwarz has been certified, for example, according to the ISO 9001 and ISO 14001 management systems.

Environmental commitment
- Energy-efficient products
- Continuous improvement in environmental sustainability
- ISO 14001-certified environmental management system

Cher client,
Vous avez choisi d’acheter un produit Rohde & Schwarz. Vous disposez donc d’un produit fabriqué d’après les méthodes les plus avancées. Le développement, la fabrication et les tests de ce produit ont été effectués selon nos systèmes de management de qualité et de management environnemental. La société Rohde & Schwarz a été homologuée, entre autres, conformément aux systèmes de management ISO 9001 et ISO 14001.

Engagement écologique
- Produits à efficience énergétique
- Amélioration continue de la durabilité environnementale
- Système de management environnemental certifié selon ISO 14001
Customer Support

Technical support – where and when you need it

For quick, expert help with any Rohde & Schwarz equipment, contact one of our Customer Support Centers. A team of highly qualified engineers provides telephone support and will work with you to find a solution to your query on any aspect of the operation, programming or applications of Rohde & Schwarz equipment.

Up-to-date information and upgrades

To keep your instrument up-to-date and to be informed about new application notes related to your instrument, please send an e-mail to the Customer Support Center stating your instrument and your wish. We will take care that you will get the right information.

1 Preface

1.1 Documentation Overview

The user documentation for the R&S SMATE consists of the following parts:

- Quick start guide, printed manual
- Online help system on the instrument
- Operating manuals and online manual for base unit and options provided on the product page
- Service manual provided on the internet for registered users
- Instrument security procedures provided on the product page
- Release notes provided on the product page
- Data sheet and brochures provided on the product page
- Application notes provided on the Rohde & Schwarz website

You find the user documentation on the R&S SMATE product page mainly at:
http://www.rohde-schwarz.com/product/SMATE200A.html > "Downloads" > "Manuals"

Additional download paths are stated directly in the following abstracts of the documentation types.

Quick Start Guide

Introduces the R&S SMATE and describes how to set up and start working with the product. Includes basic operations, typical measurement examples, and general information, e.g. safety instructions, etc.

Online Help

Offers quick, context-sensitive access to the information needed for operation and programming. It contains the description for the base unit and the software options.

Operating Manuals and Online Manual

Separate manuals are provided for the base unit and the software options:

- **Base unit** manual
  Contains the description of the graphical user interface, an introduction to remote control, the description of all SCPI remote control commands, programming examples, and information on maintenance, instrument interfaces and error messages. Includes the contents of the *quick start guide* manual.

- **Software option** manuals
  Describe the specific functions of this option. Basic information on operating the R&S SMATE is not included.

The *online manual* provides the contents of the operating manual for immediate display on the internet.
The service manual is available for registered users on the global Rohde & Schwarz information system (GLORIS).

**Instrument Security Procedures**

Deals with security issues when working with the R&S SMATE in secure areas.

**Data Sheet and Brochures**

**Release Notes**

Describes the firmware installation, new and modified features and fixed issues according to the current firmware version. You find the latest version at: [http://www.rohde-schwarz.com/product/SMATE200A.html](http://www.rohde-schwarz.com/product/SMATE200A.html) > "Downloads" > "Firmware"

**Application Notes, Application Cards, White Papers, etc.**

These documents deal with special applications or background information on particular topics, see [http://www.rohde-schwarz.com/appnotes](http://www.rohde-schwarz.com/appnotes).

### 1.2 Typographical Conventions

The following text markers are used throughout this documentation:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Graphical user interface elements&quot;</td>
<td>All names of graphical user interface elements on the screen, such as dialog boxes, menus, options, buttons, and softkeys are enclosed by quotation marks.</td>
</tr>
<tr>
<td>KEYS</td>
<td>Key names are written in capital letters.</td>
</tr>
<tr>
<td>File names, commands, program code</td>
<td>File names, commands, coding samples and screen output are distinguished by their font.</td>
</tr>
<tr>
<td>Input</td>
<td>Input to be entered by the user is displayed in italics.</td>
</tr>
<tr>
<td>Links</td>
<td>Links that you can click are displayed in blue font.</td>
</tr>
<tr>
<td>&quot;References&quot;</td>
<td>References to other parts of the documentation are enclosed by quotation marks.</td>
</tr>
</tbody>
</table>

### 1.3 Notes on Screenshots

When describing the functions of the product, we use sample screenshots. These screenshots are meant to illustrate as much as possible of the provided functions and possible interdependencies between parameters. The shown values may not represent realistic test situations.
The screenshots usually show a fully equipped product, that is: with all options installed. Thus, some functions shown in the screenshots may not be available in your particular product configuration.
2 Preparing for Use

The following topics will help you to get familiar with the instrument and perform the first steps:

- Front Panel Tour
- Rear Panel Tour
- Putting into Operation

This section explains the control elements and connectors of the Signal Generator R&S SMATE with the aid of the front and rear views and describes how to put the instrument into operation. It also describes the connection of peripherals such as printer, keyboard or mouse. Specifications of interfaces can be found in the data sheet.

Manual and remote control of the instrument

- The R&S SMATE is primarily intended to be remote-controlled via the GPIB interface or a LAN connection (see Chapter 5, “Remote Control Basics”, on page 117). Alternatively it is possible to control the instrument manually using an external monitor in combination with a keyboard and a mouse (see also Chapter 2.4, “Connecting External Accessories”, on page 28) or by accessing the instrument via the remote control desktop of an external PC (see also Chapter 2.7, “Remote Access via an External Controller”, on page 36).
- Several hardware control lines are provided for direct and fast access to instrument functions, e.g. to RF OFF and MOD OFF switching (Chapter 4.1, "Legend of Manual Controls", on page 77).
- Manual and remote control of the R&S SMATE are described in separate chapters. Background information about the settings and about the digital standards is reported in the reference chapter for manual control (see chapter "Instrument Functions" in the Operating Manual), together with the dialogs that may be displayed on an external monitor. To avoid redundancy, the reference chapter for remote control (chapter "Remote Control Commands" in the Operating Manual) focuses on program syntax and parameter ranges but contains only a short description of the command functions.

The Chapter 3, "Getting Started", on page 59 of this manual provides an overview of the generator functions and introduces the operating concept. Detailed operating instructions and an overview of menus follow in Chapter 4, "Manual Operation", on page 77.

For all reference information concerning manual and remote control of the instrument refer to the online help system or its printed/printable version. A more detailed description of the hardware connectors and interfaces is also part of the help system.

2.1 Front Panel Tour

This section gives an overview of control elements on the front panel of the R&S SMATE. The connectors of the R&S SMATE are placed on the rear panel and are described in Chapter 2.2, "Rear Panel Tour", on page 15.
As the R&S SMATE is mainly intended to be remote-controlled, the front panel of the R&S SMATE contains no display but mostly LEDs to inform the user about the status of the instrument. The user interface can be displayed on an external monitor that is either connected directly to the instrument or that belongs to a remote PC station used to manually remote control the instrument.

For more detailed information, refer to the corresponding description in the Operating Manual.

2.1.1 Status LEDs for instrument state

The Status LEDs for instrument state are located in the left corner of the front panel.

**ERROR**
Indicates that an error occurred during operation. Only errors are indicated that impair further instrument operation, e.g. a hardware fault. The error must be eliminated before correct instrument operation can be ensured.

Errors are queried with commands `SYSTem:ERRor:ALL?`, `SYSTem:ERRor[:NEXT]?` and `SYSTem:SERRor?`.

**REMOTE**
Indicates that the instrument is in remote control mode.

If using an external monitor and an external keyboard, the external display remains unchanged and shows the current instrument status, i.e. the status which exists under the remote control settings. The instrument can be operated (e.g. dialogs can be opened). However, it is not possible to enter or change values.
BUSY
Indicates that the instrument is booting the operating system and firmware software.

READY
Indicates that the instrument is ready for operation after booting the instrument.

2.1.2 Standby LEDs and Standby Key

The standby LEDs and the ON/STANDBY key are located in the bottom left corner of the front panel.

The ON/STANDBY key toggles the instrument between standby and ready state (indicated by the standby LEDs).

The standby LEDs indicate the instrument states as follow:
- the green LED (left) is on when the instrument is ready for operation,
- the yellow LED (right) is on in the standby mode.

See also Chapter 2.3.5.1, "Standby and Ready state", on page 24.

2.1.3 Status LEDs for RF outputs

The green LEDs indicate that the RF output A/B on the rear of the instrument is switched on.

2.1.4 Status LED for LXI

The LED indicates the LXI states as follow:
- the red LED is on by LAN fault or no LAN connection
- the green LED indicates that LAN is active (normal operation)
- the green LED flasches by device indentification.

2.1.5 LAN Reset

The LAN Reset initiates the network configuration reset mechanism for the instrument and resets the network settings of the instrument when pressed for longer than 4 sec.

For more information, refer to section "LXI Status" in the Operating Manual.

2.2 Rear Panel Tour

This section gives an overview of connectors on the rear panel of the instrument. Each connector is briefly described and a reference is given to the chapters containing detailed information. For technical data of the connectors refer to the data sheet.
If a connector of a two-path instrument is available for one path only (for example path A) or for either of the two (path A or B), a note is made in the brief description.

For more detailed information, refer to the corresponding description in the Operating Manual.

---

### 2.2.1 Description of the Connectors

**RF A, RF B**

Outputs for RF signal of path A and path B.

**NOTICE!** Maximum Input Levels. Do not overload the RF output. The maximum permissible back-feed is specified in the data sheet.

The RF signals are output via N female connectors.

**NOTICE!** Risk of RF connector and cable damage. Excessive tightening of the connectors can damage the cables and connectors. Too weak tightening leads to inaccurate results.

Always use an appropriate torque wrench suitable for this type of connector and apply the torque specified in the application note 1MA99.

The application notes are available on the Internet and provide additional information on care and handling of RF connectors.

Rohde & Schwarz offers appropriate torque wrenches for various connectors. For ordering information see the R&S SMATE data sheet or product brochure.
LAN CONNECTOR
Ethernet interface
- For integrating signal generators in a network
- Remote control of signal generator
- Input of external asynchronous data
- Remote access to the signal generator
- Firmware update
See also:
- Chapter 2.6, "Setting Up a Network (LAN) Connection", on page 31
- chapter "Remote Control Basics" in the Operating Manual

VENTILATION SLOTS
NOTICE! Risk of damage through overheating!. Ventilation slots must not be obstructed. Make sure that the air can escape freely through the vents at the rear. The minimum distance to the wall should be at least 10 cm.

AC SUPPLY AND POWER SWITCH
When the R&S SMATE is connected to the AC supply, it automatically sets itself to the correct range for the applied voltage (range: see type label). There is no need to set the voltage manually or change fuses.
The instrument comes with or without a power switch, depending on the design of the otherwise technically equivalent power supply unit.
The power switch can be set to two positions:
- 0 The instrument is disconnected from the mains.
- 1 The instrument is power-supplied. It is either ready for operation (STANDBY) or in operating mode, depending on the position of the ON/STANDBY switch on the instrument front.
See also data sheet and Chapter 2.3.4, "Connecting the Instrument to the AC Supply", on page 23.

REF OUT
Output of internal reference signal.

REF IN
Input for external reference signal.
The external reference is used for both paths.

CLOCK IN/OUT
Clock signal input/output.
CLOCK IN Input for external clock signal (bit or symbol clock, multiple of symbol clock) for synchronizing the external data signal in case of multivalent modulation. The active edge can be set (path A only).
CLOCK OUT Output for internal (bit or symbol) clock signal (path A). The internal clock signal of path B can be output at one of the USER interfaces.
**R&S®SMATE200A**

**Preparation for UseR&S®**

**SMATE200A**

18

Quick Start Guide 1401.0933.69 ─ 08

**Rear Panel Tour**

**LF**
(path A only)
Output for internal LF modulation generator signal.
See also data sheet and Operating Manual, section "LF Generator and LF Output".

**I OUT BAR / Q OUT BAR**
(path A or path B)
Differential (inverting) output for analog I/Q signal.

**I OUT / Q OUT**
(path A or path B)
Direct output or Differential (non-inverting) output for analog I/Q signal.
Option option R&S SMATE-B16 is required.

**I IN A/B, Q IN A/B**
Input for external analog modulation signal in case of I/Q modulation (independent for path A and B).
For more information see chapter "Data and Signal Sources in Baseband" and "I/Q Settings" in the Operating Manual.

**EXT MOD**
Input for external analog modulation signals.
The instrument is equipped with two separate inputs for path A and path B.

**LO IN, LO OUT**
Local oscillator input and output:
- LO IN: Input for external LO signals
- LO OUT: Output for internal LO signals.

**IEC 625/IEEE 488**
IEC-bus (IEEE 488) interface for remote control of the instrument.
See also Chapter A.1, "GPIB Bus Interface", on page 167 and chapter "Remote Control Basics" in the Operating Manual.

**Note:** In order to avoid electromagnetic interference (EMI) caused by open lines, always terminate any connected IEC-bus cable with an instrument or a controller.

**USB IN**
USB (universal serial bus) interface of type B (device USB).
This interface can be used for remote control of the instrument.
Input for external asynchronous modulation data (path A only). The interface establishes a connection to the DACIF module.
If required, separate drivers can be developed for this interface. The device ID required in this case is 11 (HEX) for remote control and 12 (HEX) for the transmission of modulation data. The vendor ID is AAD (HEX).
USB CONNECTORS TYPE A
- Connection of peripherals such as mouse, keyboard, etc.
- Connection of memory stick for file transmission
- Firmware update

The interface establishes a connection to the controller.

See also Chapter 2.4.1, "Connecting USB Devices", on page 28.

MONITOR
Connector for external monitor (see Chapter 2.4.2, "Connecting a Monitor", on page 29).

For description of this connector, refer to Chapter A.3, "Monitor Connector (MONITOR)", on page 170.

AUX I/O
Parallel input/output for data signals as well as settable trigger and control signals of the baseband. Input for device trigger.

Assignment of the AUX I/O interface and of USER pins can be configured in the "Setup > Global Trigger/Clock/External Inputs" and "Setup > USER Marker / AUX I/O Settings".

Use this dialogs to configure also the arbitrary assignment of pins to path A or B.

Note: An adapter of the AUX I/O interface to coaxial BNC connectors is available as an accessory (R&S SMATE-Z5, see data sheet).

For detailed description of the AUX I/O connector, refer to Chapter A.2, "AUX I/O Connector", on page 168.

DIGITAL I/O
Input/output for serial data of digital signals as well as settable trigger and control signals of the baseband. Input for device trigger for path A.

Assignment of most of the pins of the DIGITAL I/O interface is permanent and cannot be changed. Some of the pins are assigned the same input/output as pins of the AUX I/O interface, e.g. CLK OUT. This is provided to enable the use of a single connector for the input of parallel or serial data.

Assignment of the USER pin can be configured in the SETUP > "Global Trigger/Clock/External Inputs" and "USER Marker / AUX I/O Settings". The corresponding SCPI command is \texttt{:OUTPUT:USER}.

An adapter of the DIGITAL I/O interface to coaxial BNC connectors is available as an accessory (R&S SMATE-Z5, see data sheet).

For a description of the connector, see Chapter A.4, "Digital I/O interface", on page 170.
2.3 Putting into Operation

This section describes the basic steps to be taken when setting up the R&S SMATE for the first time.

**WARNING**

Risk of injury and instrument damage

The instrument must be used in an appropriate manner to prevent electric shock, fire, personal injury, or damage.

- Do not open the instrument casing.
- Read and observe the "Basic Safety Instructions" delivered as a printed brochure with the instrument.
  In addition, read and observe the safety instructions in the following sections.
  Notice that the data sheet may specify additional operating conditions.

**NOTICE**

Risk of instrument damage

Note that the general safety instructions also contain information on operating conditions that will prevent damage to the instrument. The instrument's data sheet may contain additional operating conditions.

**NOTICE**

Risk of instrument damage during operation

An unsuitable operating site or test setup can cause damage to the instrument and to connected devices. Ensure the following operating conditions before you switch on the instrument:

- All fan openings are unobstructed and the airflow perforations are unimpeded. The minimum distance from the wall is 10 cm.
- The instrument is dry and shows no sign of condensation.
- The instrument is positioned as described in the following sections.
- The ambient temperature does not exceed the range specified in the data sheet.
- Signal levels at the input connectors are all within the specified ranges.
- Signal outputs are correctly connected and are not overloaded.
**NOTICE**

**Risk of electrostatic discharge (ESD)**

Electrostatic discharge (ESD) can cause damage to the electronic components of the instrument and the device under test (DUT). ESD is most likely to occur when you connect or disconnect a DUT or test fixture to the instrument's test ports. To prevent ESD, use a wrist strap and cord and connect yourself to the ground, or use a conductive floor mat and heel strap combination.

For details refer to the basic safety instructions included at the front of the manual.

---

**2.3.1 EMI Suppression**

Electromagnetic interference (EMI) may affect the measurement results.

To suppress generated Electromagnetic Interference (EMI),

- Use suitable shielded cables of high quality. For example use double-shielded RF and LAN cables.
  
  **Note:** USB cables are of varying and often poor quality. Therefore, check the quality of each individual USB cable as described in the service manual.

- Always terminate open cable ends.

- Note the EMC classification in the data sheet

**2.3.2 Unpacking and Checking the Instrument**

To remove the instrument from its packaging and check the equipment for completeness, proceed as follows:

1. Pull off the polyethylene protection pads from the instrument's rear feet and then carefully remove the pads from the instrument handles at the front.

2. Pull off the corrugated cardboard cover that protects the rear of the instrument.

3. Carefully unthread the corrugated cardboard cover at the front that protects the instrument handles and remove it.

4. Check the equipment for completeness using the delivery note and the accessory lists for the various items.

5. Check the instrument for any damage. If there is damage, immediately contact the carrier who delivered the instrument. Make sure not to discard the box and packing material.
Packing material
Retain the original packing material. If the instrument needs to be transported or shipped at a later date, you can use the material to protect the control elements and connectors.

2.3.3 Placing or Mounting the Instrument

The R&S SMATE is designed for use under laboratory conditions, either on a bench top or in a rack using a rack adapter kit (order number see data sheet).

Bench Top Operation
If the R&S SMATE is operated on a bench top, the surface should be flat. The instrument can be used in horizontal position, standing on its feet, or with the support feet on the bottom extended.

CAUTION

Risk of injury if feet are folded out
The feet may fold in if they are not folded out completely or if the instrument is shifted. This may cause damage or injury.
- Fold the feet completely in or completely out to ensure stability of the instrument. Never shift the instrument when the feet are folded out.
- When the feet are folded out, do not work under the instrument or place anything underneath.
- The feet can break if they are overloaded. The overall load on the folded-out feet must not exceed 500 N.
Risk of injury and instrument damage if stacking instruments
A stack of instruments may tilt over and cause injury. Furthermore, the instruments at the bottom of the stack may be damaged due to the load imposed by the instruments on top.

Observe the following instructions when stacking instruments:

- Never stack more than three instruments with the same dimensions (width and length). If you need to stack more than three instruments, install them in a rack.
- The overall load imposed on the lowest instrument must not exceed 500 N.
- All instruments should have the same dimensions (width and length). If you need to stack smaller instruments on the top, the overall load imposed on the lowest instrument must not exceed 250 N.
- If the instruments have foldable feet, fold them in completely.

Rackmounting
The R&S SMATE can be installed in a rack using a rack adapter kit (Order No. see data sheet). The installation instructions are part of the adapter kit.

Risk of instrument damage in a rack
An insufficient airflow can cause the instrument to overheat, which may disturb the operation and even cause damage.

Make sure that all fan openings are unobstructed, that the airflow perforations are unimpeded, and that the minimum distance from the wall is 10 cm.

2.3.4 Connecting the Instrument to the AC Supply
The R&S SMATE is automatically adapted to the AC voltage supplied. There is no need to set the voltage manually or change fuses. The AC SUPPLY AND POWER SWITCH is at the rear of the unit.
Connect the instrument to the AC power source using the AC power cable delivered with the instrument.

**Note:** The instrument is in compliance with safety class EN61010-1. Connect the instrument only to a socket with earthing contact.

### 2.3.5 Starting the Instrument

The R&S SMATE comes with or without a power switch, depending on the design of the otherwise technically equivalent power supply unit.

**Switching off the AC power**

You can leave the AC power on permanently to preserve your last instrument settings. Switching off is required only if the instrument must be completely disconnected from all power supplies.

**Starting up instruments with power switch**

1. Connect the instrument to the AC supply.
2. To turn the power on, press the main power switch to position I (On).
   After power-up, the instrument is in standby or ready state, depending on the state of the ON/STANDBY key at the front panel of the instrument when the instrument was switched off for the last time.
3. In case the instrument is in standby mode, i.e. the yellow LED is on, press the ON/STANDBY key to switch the instrument to ready state.

**Starting up instruments without power switch**

1. Connect the instrument to the AC supply.
   After connection to the AC supply, the instrument is in standby or ready state, depending on the state of the ON/STANDBY key at the front panel of the instrument when the instrument was switched off for the last time.
2. In case the instrument is in standby mode, i.e. the yellow LED is on, press the ON/STANDBY key to switch the instrument to ready state.

#### 2.3.5.1 Standby and Ready state

The ON/STANDBY key is located in the bottom left corner of the front panel.

**Switching between standby and ready state**

Press the ON/STANDBY key briefly to switch the instrument from the standby to ready state or vice versa.

In ready state, the left, green LED is on. The instrument is ready for operation. All modules are power-supplied and the R&S SMATE initiates its startup procedure.
In standby state, the right, yellow LED is on. The standby power only supplies the power switch circuits and the oven-controlled crystal oscillator to keep it at its operating temperature. In this state it is safe to switch off the AC power and disconnect the instrument from the power supply.

2.3.5.2 Start Display and Booting

After power-on, the start display indicates for a few seconds the installed BIOS version and the processor characteristics.

The instrument boots the operating system, starts the instrument firmware and automatically performs a selftest. If the previous session was terminated regularly, the instrument uses the last setup with the relevant instrument settings.

Once the startup procedure has been terminated, the block diagram opened in the previous session is displayed and the instrument is ready for operation.

Use the PRESET key to return the instrument to its definite reset/preset state, if the current setup is not anymore relevant.

To customize the start settings, use the "File" dialog.

Rebooting the instrument

Press the STANDBY key for approx. 5 s. to reboot the instrument, if the software stops unexpectedly.

2.3.5.3 Function Check

The signal generator automatically monitors the main functions when the instrument is switched on and continuously during operation.

A detected fault is indicated by a "ERROR" message displayed in the info line together with a brief error description. For in-depth identification of the error, press the INFO key. In response, a description of the error(s) is displayed.

For more information, refer to section "Error Messages" in the Operating Manual.

Additionally to the automatic monitoring, the R&S SMATE offers the following capabilities to ensure correct functioning:

- Internal Adjustments
  Press the SETUP key and select "System > Internal Adjustments" to access the dialog for performing and configuring of the adjustments settings. A maximum level accuracy can be obtained, for instance.

- Selftest
  A selftest is provided for service purposes. The selftest is a protected test procedure, which can be accessed if protection level 1 is disabled.
2.3.5.4 Default Settings

When the instrument is switched on, it is not the preset state that is active, but rather the instrument state that was set before the instrument was switched off. It is also recommended that you use the PRESET key to return the instrument to its defined preset state every time a new configuration is required or the current setup is not anymore relevant.

The R&S SMATE offers a three-stage preset concept:

- **Preset of the settings belonging to a digital standard or associated with one dialog.** Most of the dialog boxes provide a special "Set to Default" button that resets directly the settings associated to the corresponding dialog, e.g. all digital modulation settings in the "Custom Digital Mod" dialog. These settings are identical to those which are called up using the PRESET key.

- **Preset the instrument to a predefined state**
  The PRESET key calls up a defined instrument setup. All parameters and switching states are preset (also those of inactive operating modes). The default instrument settings provide a reproducible initial basis for all other settings. However, functions that concern the integration of the instrument into a measurement setup are not changed, e.g. GPIB bus address or reference oscillator source settings. In remote control it is possible to preset the settings of the two instrument's paths separately (see section "Preset Commands").

- **Preset the instrument to its factory settings**
  The instrument can also be forced to load its default factory settings. To access the corresponding dialog box, press the SETUP key and select the "Factory Preset". For more information and an overview of the settings affected by the factory preset function, see section "Factory Preset" in the Operating Manual.

**Overview of the Most Important Preset States**

The following list gives an overview of the presets for the most important generator settings. The other presets can be found in the preset tables of the individual menus and the information accompanying the remote commands.

- "RF frequency" = 1 GHz
- "RF level" RF output switched off
- "Offsets" = 0
- "Modulations State" = Off
- Uninterrupted level settings are switched off
  "Level Attenuator Mode" = AUTO
- Internal level control "Level ALC" = AUTO
- User correction "Level Ucor" = OFF
- "LF output State" = Off
- "Sweep State" = Off
- "List mode State" = Off

Settings that are not affected by the PRESET key

- Reference frequency settings ("Ref Oscillator" menu)
User-defined instrument states can be stored and called up in the "File" dialog.

### 2.3.6 Shutting Down the Instrument

To shut down the R&S SMATE, proceed as described below.

#### NOTICE

**Risk of losing data**

If you switch off the running instrument using the rear panel switch or by disconnecting the power cord, the instrument loses its current settings. Furthermore, program data may be lost.

Press the ON/STANDBY key first to shut down the application properly.

1. Press the ON/STANDBY key to save the current setup, shut down the operating system and set the instrument to standby state.
   The yellow LED must be on.
2. To turn the power off:
   a) For instruments with power switch, press the main power switch to position 0 (Off).
   b) For instruments without power switch, pull the power cable at the rear of the instrument.

**Tip:**

Switching off the AC power

You can leave the AC power on permanently to preserve your last instrument settings. Switching off is required only if the instrument must be completely disconnected from all power supplies.

None of the front-panel LEDs should be on.
2.4 Connecting External Accessories

The equivalent USB ports on the front and/or rear panel of the R&S SMATE can be used to connect a variety of accessories.

In addition the instrument provides interfaces for monitor connection and network integration (see Chapter 2.4.2, "Connecting a Monitor", on page 29 and Chapter 2.6.1, "Connecting the Instrument to the Network", on page 32).

2.4.1 Connecting USB Devices

The USB interfaces of the R&S SMATE allow you to connect USB devices directly to the instrument. This number can be increased as necessary by using USB hubs. Due to the large number of available USB devices, there is almost no limit to the expansions that are possible with the R&S SMATE.

The following list shows various USB devices that can be useful:

- Memory stick for easy transfer of data to/from a computer (e.g. firmware updates)
- CD-ROM drives for easy installation of firmware applications
- Keyboard or mouse to simplify the entry of data, comments, file names, etc.
- Printer for printing out measurement results
- Power sensors, e.g. of the NRP Zxy family

Installing USB devices is easy under Windows, because all USB devices are plug&play. After a device is connected to the USB interface, the operating system automatically searches for a suitable device driver.

If Windows does not find a suitable driver, it will prompt you to specify a directory that contains the driver software. If the driver software is on a CD, connect a USB CD-ROM drive to the instrument before proceeding.

When a USB device is subsequently disconnected from the R&S SMATE, Windows immediately detects the change in hardware configuration and deactivates the corresponding driver.

All USB devices can be connected to or disconnected from the instrument during operation.

Connecting a memory stick or CD-ROM drive

If installation of a memory stick or CD-ROM drive is successful, Windows informs you that the device is ready to use. The device is made available as a new drive and is displayed in Windows Explorer. The name of the drive depends on the manufacturer.

Connecting a keyboard

The keyboard is detected automatically when it is connected. The default input language is English – US.
Select "Start > Control Panel > Clock, Language, and Region > Change keyboards or other input methods" to configure the keyboard properties. To access the Windows operating system, press the Windows key on the external keyboard.

Connecting a mouse

The mouse is detected automatically when it is connected.

Select "Start > Control Panel > Devices and Printers > Mouse" to configure the mouse properties. To access the Windows operating system, press the Windows key on the external keyboard.

Connecting a printer

When printing a file, the instrument checks whether a printer is connected and turned on and whether the appropriate printer driver is installed. If required, printer driver installation is initiated. A printer driver needs to be installed only once.

To install a printer, select "Start > Control Panel > Devices and Printers > Add a printer". To access the Windows operating system, press the Windows key on the external keyboard.

You can load updated and improved driver versions or new drivers from an installation disk, USB memory stick or another external storage medium. If the instrument is integrated in a network, you can also install driver data stored in a network directory.

Select "Start > Control Panel > Devices and Printers > Device Manager > Update Device drivers" to install the driver.

2.4.2 Connecting a Monitor

An external monitor with an analog interface can be connected to the MONITOR connector on the rear panel of the instrument. Per default, the external monitor connector is disabled and has to be enabled before operation.

Connecting external devices

Before connecting any external device such as a monitor, make sure that the instrument is switched off (or in standby mode). Otherwise, correct operation cannot be assured. This does not apply to USB devices.

1. Shut down the instrument.
   None of the front-panel LEDs should be on.

2. Plug in the monitor cable to the MONITOR connector on the rear panel of the instrument.

3. Start up the instrument.
   The green LED must be on.
   The external monitor is detected.
The entire display of the instrument, containing the status bar, the block diagram and the winbar is displayed on the monitor additionally. Further settings are not required.

The MONITOR interface is described in "Appendix A: Hardware Interfaces" in the Operating Manual.

2.5 Windows Operating System

The instrument contains the Windows Embedded Standard operating system which has been configured according to the instrument's features and needs. Changes in the system setup are only required when peripherals like keyboard or a printer are installed or if the network configuration does not comply with the default settings. After the R&S SMATE is started, the operating system boots and the instrument firmware is started automatically.

To ensure that the instrument software functions properly, certain rules must be adhered to concerning the operating system.

**NOTICE**

Risk of causing instrument unusability

The instrument is equipped with the Windows Embedded Standard operating system. Additional software can therefore be installed on the instrument. The use and installation of additional software may impair instrument function. Thus, run only programs that Rohde & Schwarz has tested for compatibility with the instrument software.

The drivers and programs used on the instrument under Windows Embedded Standard have been adapted to the instrument. Existing instrument software must always be modified using only update software released by Rohde & Schwarz.

The following program packages have been tested:

- R&S Power Viewer Plus - virtual power meter for displaying results of the Power Sensor R&S NRP-Zxx (install only this component!)
- Symantec Endpoint Security – Virus-protection software
- FileShredder - for reliable deletion of files on the hard disk

In certain cases, the use of these programs can impair the performance of the instrument.

2.5.1 Virus Protection

Users must take appropriate steps to protect their instruments from infection. Beside the use of strong firewall settings and regularly scanning any removable storage device used with a Rohde & Schwarz instrument, it is also recommended that anti-virus software be installed on the instrument. While Rohde & Schwarz does NOT recommend running anti-virus software in the background ("on-access" mode) on Windows-based
instruments, due to potentially degrading instrument performance, it does recommend running it during non-critical hours.

For details and recommendations, see the Rohde & Schwarz White Paper 1DC01: Malware Protection.

2.5.2 Service Packs and Updates

Microsoft regularly creates security updates and other patches to protect Windows-based operating systems. These are released through the Microsoft Update website and associated update server. Instruments using Windows, especially those that connect to a network, should be updated regularly.

For details and recommendations, see the Rohde & Schwarz White Paper 1DC01: Malware Protection.

2.5.3 Login

Windows Embedded Standard requires that users identify themselves by entering a user name and password in a login window. The instrument provides a factory-installed auto login function, i.e. login is carried out automatically in the background. The ID used for autologin has administrator rights so that printer and network installations are possible. The user name and password are set to "instrument".

2.5.4 Accessing the Start Menu

All necessary system settings can be defined in the "Start > Control Panel" menu (for required settings refer to the Windows Embedded Standard documentation and to the hardware description).

Energy saving mode

An energy saving mode is a default setting in the instrument. The hard disk switches to power-save mode if it is not accessed for 30 minutes. The energy-saving mode is exited by accessing the hard disk again.

2.6 Setting Up a Network (LAN) Connection

The R&S SMATE is equipped with a network interface and can be connected to an Ethernet LAN (local area network). Provided the appropriate rights have been assigned by the network administrator and the Windows firewall configuration is adapted accordingly, the interface can be used, for example:

- To transfer data between a controlling device and the test device, e.g. in order to run a remote control program.
- To access or control the measurement from a remote computer using the "Remote Desktop" application (or a similar tool)
- To connect external network devices (e.g. printers)
- To transfer data from a remote computer and back, e.g. using network folders

This section describes how to configure the LAN interface. It includes the following topics:
- Chapter 2.6.1, "Connecting the Instrument to the Network", on page 32
- Chapter 2.6.2, "Assigning the IP Address", on page 33

**LXI**

The R&S SMATE complies with LXI Class C. LXI gives you direct access to the LAN settings described below.

**Accessing Operating System**

The operating system can only be accessed if an external keyboard and/or a mouse is connected. Windows provides an on-screen keyboard that can be operated using a mouse, thus enabling operation by mouse only. An external keyboard is recommended for extensive entries.

### 2.6.1 Connecting the Instrument to the Network

There are two methods to establish a LAN connection to the instrument:

- A non-dedicated network (Ethernet) connection from the instrument to an existing network made with an ordinary RJ-45 network cable. The instrument is assigned an IP address and can coexist with a computer and with other hosts on the same network.
- A dedicated network connection (Point-to-point connection) between the instrument and a single computer made with a (crossover) RJ-45 network cable. The computer must be equipped with a network adapter and is directly connected to the instrument. The use of hubs, switches, or gateways is not required, however, data transfer is still performed using the TCP/IP protocol. An IP address has to be assigned to the instrument and the computer, see Chapter 2.6.2, "Assigning the IP Address", on page 33.

The R&S SMATE uses the IP addresses 192.168.xxx.yyy for this purposes, where xxx and yyy may take values between 1...254; the subnet mask is always 255.255.255.0.

**NOTICE**

**Risk of network failure**

Before connecting the instrument to the network or configuring the network, consult your network administrator. Errors may affect the entire network.
To establish a non-dedicated network connection, connect a commercial RJ-45 cable to one of the LAN ports.

To establish a dedicated connection, connect a (crossover) RJ-45 cable between the instrument and a single PC.

If the instrument is connected to the LAN, Windows automatically detects the network connection and activates the required drivers.

The network card can be operated with a 10/100/1000 Mbps Ethernet IEEE 802.3u interface.

### 2.6.2 Assigning the IP Address

Depending on the network capacities, the TCP/IP address information for the instrument can be obtained in different ways.

- If the network supports dynamic TCP/IP configuration using the Dynamic Host Configuration Protocol (DHCP), all address information can be assigned automatically.
- If the network does not support DHCP, or if the instrument is set to use alternate TCP/IP configuration, the addresses must be set manually.

By default, the instrument is configured to use dynamic TCP/IP configuration and obtain all address information automatically. This means that it is safe to establish a physical connection to the LAN without any previous instrument configuration.

#### NOTICE

**Risk of network errors**

Connection errors can affect the entire network. If your network does not support DHCP, or if you choose to disable dynamic TCP/IP configuration, you must assign valid address information before connecting the instrument to the LAN. Contact your network administrator to obtain a valid IP address.

**Assigning the IP address manually**

1. Obtain the IP address and subnet mask for the R&S SMATE and the IP address for the local default gateway from your network administrator. If necessary, also obtain the name of your DNS domain and the IP addresses of the DNS and WINS servers on your network. If you use more than one LAN connector, you need separate address information for each connector.
2. Press the "Windows" key to access the operating system.
3. Open the "Control Panel" by selecting "Start > Settings > Control Panel".
4. Select "Network Connections".
5. Right-click "Local Area Connection" and select "Properties" from the context-sensitive menu, or...
click "Local Area Connection" and then "File > Properties".

6. On the "General" tab, click "Internet Protocol (TCP/IP)" and then select "Properties".

7. Select "Use the following IP address" and enter the address information as obtained from the network administrator.

8. If necessary, you can also select "Use the following DNS server addresses" and enter your own DNS addresses.

For more information refer to the Windows Help.

2.6.3 Using computer names

In a LAN that uses a DNS server (Domain Name System server), each PC or instrument connected in the LAN can be accessed via an unambiguous computer name instead of the IP address. The DNS server translates the host name to the IP address. This is especially useful when a DHCP server is used, as a new IP address may be assigned each time the instrument is restarted.

Each instrument is delivered with an assigned computer name, but this name can be changed.

The default instrument name is a non-case-sensitive string that follows the syntax `rs<instrument><serial number>`.

The serial number can be found on the rear panel of the instrument. It is the third part of the device ID printed on the bar code sticker:

![ID: 1419.0035K02 - 101441 - Zd Serial Number]

Querying and changing a computer name

1. Press the "Windows" key to access the operating system.

2. Select "Start > My Computer > Properties > Computer Name".

   The computer name is displayed under "Full Computer Name".

3. To change the computer name, select "Change", enter the new computer name and confirm the entry.

2.6.4 Changing the Windows Firewall Settings

A firewall protects an instrument by preventing unauthorized users from gaining access to it through a network. Rohde & Schwarz highly recommends the use of the firewall on your instrument. Rohde & Schwarz instruments are shipped with the Windows firewall...
enabled and preconfigured in such a way that all ports and connections for remote control are enabled.

For more details on firewall configuration, see the Rohde & Schwarz White Paper 1DC01: Malware Protection.

Note that changing firewall settings requires administrator rights.

To transfer waveform files generated on an external PC using R&S WinIQSIM2, you have to disable the firewall.

**NOTICE**

**Risk of Unauthorized Access**

Disabling the firewall or allowing exceptions may make your instrument more vulnerable to viruses and intruders.

It is recommended that you restore the default firewall configuration after completing a task which requires modified settings.

2.6.5 Working with Directories

Access to network drives depends on access rights and whether the drives in question have been enabled. The complete integration of the R&S SMATE into a larger network with the necessary allocation of rights is highly complex and normally performed by a network administrator.

However, the hard disk of a computer also connected to the network can be accessed from the instrument relatively easily. The only precondition is that the directory on the remote computer that the instrument should access is enabled for remote access. Subsequently, this directory is accessed from the instrument using a Windows Embedded Standard search function. This procedure is also of importance for a point-to-point connection, for instance in order to start a firmware update for which the files have been stored on the hard disk of the remote computer.

The computer and the instrument must both be provided with a computer name and an IP address (see Chapter 2.6.2, “Assigning the IP Address”, on page 33).

Enabling directories on the remote computer

The menu name may deviate from the name specified in the operating sequence, depending on the language and on the operating system used on the computer.

1. On the remote computer, in Windows Explorer, click the directory to be enabled.
2. From the context menu, select "Properties".
3. Select the "Sharing" tab and enable "Share this folder".

**Accessing the enabled directory**

1. On the instrument, select "Start > Search > For Files and Folders > Printers, Computers > A Computer in the Network".
2. Enter the computer name and press ENTER to start the search.
   The computer and its name appears in the results list.
3. Click the computer's name to display the enabled directory.
   **Note:** If a user name and password are requested when you click the computer, the login name and password used on the computer must be entered.
   The files in this directory can be accessed by the instrument.

### 2.7 Remote Access via an External Controller

The R&S SMATE can be remote accessed from a remote computer (external controller) via a network link. This allows convenient operation of the instrument from the desktop although the instrument is integrated in a rack somewhere else.

For an overview of the instrument's operating concept and the different ways to control and operate the instrument, see Chapter 3.1, "Brief Introduction to the Instrument's Concept", on page 59.

There are different ways to establish a remote access connection to the signal generator but all of them require an established LAN connection between the instrument and the remote computer. The simplest way to remote access the instrument is to use a Web browser, such as Windows Internet Explorer or Mozilla Firefox for instance. Alternatively a remote access via a special application can be used.

For example, the free-of-charge programs "Remote Desktop" for PCs with windows operating system, or "Ultr@VNC" for PCs with Linux/Unix or Windows operating system are available for setting up the remote access connection. Using these applications requires additional installation.

See the following table for an overview of the different ways to establish a remote access connection to the signal generator.
### Table 2-1: Remote access via an external computer

</tbody>
</table>

When the connection is set up with Remote Desktop, the device firmware of the signal generator is disabled. Direct control on the instrument is not possible while manual remote-control is active. The access of an external PC is indicated by the logon screen of the operating system which identifies the accessing user.

When the connection is set up with a VNC client software (Ultr@VNC), direct control on the instrument is possible while remote access is established.

For return to direct operation on the instrument, the connection must be cut. After cutting the connection, it is still enabled and can be established again any time. The connection is disabled only after deactivation of the program.

This section gives an information on how to use the Web browser for remote access, how to install the applications for remote access and how to establish the connection between the instrument and an external computer with Windows operating system. Remote access via an external computer with Linux/Unix operating system is performed accordingly.

### Accessing Operating System
The operating system can only be accessed if an external keyboard and/or a mouse is connected. Windows provides an on-screen keyboard that can be operated using a mouse, thus enabling operation by mouse only. An external keyboard is recommended for extensive entries.
2.7.1 Using a Web Browser for Remote Access

The instrument can be remote-accessed via any web browser, as for example the Windows Internet Explorer or Mozilla Firefox.

Alternatively, you can also make use of the LXI browser, as described in Chapter 2.9.2.4, "Web Control", on page 55.

To remote access the instrument via a web browser:

1. Connect the instrument and the remote computer to a LAN, see Chapter 2.6.1, "Connecting the Instrument to the Network", on page 32.

2. Install the Java Runtime Environment JRE on the remote computer.

3. Type the instrument's IP address in the address field of the Web browser on your PC, e.g. http://10.111.11.1

   The "VNC Authentication" screen appears.

4. Enter the password and select "OK".

   The default password is "instrument".

   After the connection is established, the current signal generator screen with the block diagram is displayed and the instrument can be remote-accessed from the remote computer.

2.7.2 Remote Desktop Connection

Remote Desktop is a Windows application which can be used to access and control the instrument from a remote computer through a LAN connection. While the instru-
Remote Access via an External Controller

When Instrument is in operation, the instrument screen contents are displayed on the remote computer, and Remote Desktop provides access to all of the applications, files, and network resources of the instrument. Thus, remote operation of the instrument is possible.

**NOTICE**

**Risk of Unauthorized Access**

If the Windows Remote Desktop application is enabled on the instrument (go to "Start > Settings > Control Panel > System"), any user in the network who knows the computer name and login data can access it. To prevent this, make sure that the Remote Desktop application on the instrument is disabled.

**To set up a Remote Desktop connection**

1. Enable remote desktop control on the instrument.
2. Connect the instrument and the remote computer to a LAN, see Chapter 2.6.1, "Connecting the Instrument to the Network", on page 32.
3. Set up the Remote Desktop connection between the remote computer and the instrument.

**Remote Desktop Client**

With Windows Embedded Standard, Remote Desktop Client is part of the operating system and can be accessed via "Start > Programs > Accessories > [Communications >] Remote Desktop Connection."

For other versions of Windows, Microsoft offers the Remote Desktop Client as an add-on.

**Enabling remote desktop control on the instrument**

1. Press the "Windows" key to access the operating system.
2. Open the Control Panel by selecting "Start > Settings > Control Panel".
3. Select "System" and switch to the "Remote" tab.
4. Under "Remote Desktop", activate the "Allow users to connect remotely to this computer" option.

**Note:** Remote Desktop access and firewall settings. When you enable or disable the Windows Remote Desktop option (in the "System Properties"), the associated firewall settings are adapted automatically.

5. If necessary, click "Select Remote Users" and select users who are to be given access to the R&S SMATE via Remote Desktop. The user account under which configuration is carried out is automatically enabled for Remote Desktop.
Setting up the Remote Desktop connection on the remote computer

1. On the remote computer, select "Start > Programs > Accessories > [Communications] > Remote Desktop Connection."

2. Enter the instrument's name or IP address in the dialog box (see also Chapter 2.6.2, "Assigning the IP Address", on page 33).

3. Enter the user ID and password for the instrument (see also Chapter 2.5, "Windows Operating System", on page 30).

4. Click "Connect".

When the connection has been set up, the instrument's screen appears on the remote computer.

Disabled Direct Control
While remote access is active, the direct control of the instrument is disabled. Remote access is indicated on the instrument by the logon screen of the operating system. The logon screen identifies the accessing user.

For simultaneous remote access of several instruments from the same PC, a separate Remote Desktop session must be opened for each instrument.

For detailed information about Remote Desktop and the connection refer to the Windows Help.

Helpful settings for Remote Desktop
The following settings for the Remote Desktop connection can make working on the remote PC more convenient.

1. When setting up the connection to the instrument, you can configure the connection settings in the "Remote Desktop Connection" dialog box. Click the "Options >>" button.

2. Customize the settings:
   - On the "Experience" tab:
     - Select the appropriate connection to optimize the connection speed.
     - To improve the performance, you can deactivate options you do not require under "Allow the following".
   - On the "Local Resources" tab:
     - If you need to access drives of the remote PC from the instrument (e.g. in order to store settings or to copy files from the PC to the instrument), activate the "Disk drives" option. Windows Embedded Standard will then map drives of the remote PC to the corresponding network drives. When a connection is established, a warning is displayed on the PC indicating that the drives are enabled for access from the instrument.
To use printers connected to the remote PC while accessing them from the instrument, activate the "Printers" options. Do not change the remaining settings.

- **On the "Display" tab:**
  - Under "Remote desktop size", set the size of the R&S SMATE window on the desktop of the remote PC.
  - Activate the "Display the connection bar when in full screen mode" option. A bar showing the network address of the instrument is displayed on the screen which you can use to reduce, minimize or close the window.

- **On the "General" tab:**
  You can save the connection settings for later use using the "Save As" button.

### Terminating Remote Desktop Control

A Remote Desktop connection can be terminated either on the R&S SMATE or on the remote PC. The connection can be established again any time as long as remote control is enabled on the instrument. Consider the notice above concerning unauthorized access due to Remote Desktop!

1. To terminate the connection on the instrument, click "Disconnect" in the remote-control message menu of the R&S SMATE.

2. To terminate the connection on the remote PC, close the "Remote Desktop" window, or select "Start > Disconnect".

### Disabling Remote Desktop Control

To disable the remote access, deactivate the Remote Desktop on the instrument.

- Under "Remote Desktop", disable the "Allow users to connect remotely to this computer" option and confirm with "OK".

  The connection is disabled, it is no longer possible to access the instrument via Remote Desktop.

### 2.7.3 Remote Access via a VNC Client Software

A VNC client software is an application which can be used to access and control the instrument from a remote computer via LAN.

The following description explains how to establish the remote access, represented by means of the client software Ultr@VNC. The software is included in Linux/Unix operating system, but it is also available as a free-of-charge download on the Internet [http://www.uvnc.com/download/index.html](http://www.uvnc.com/download/index.html). Thus, it is also available for remote computers with Windows operating system.

The GUI appearance of Ultr@VNC may vary if you use a later release. Also, similar programs may deviate in some details, but the basic procedure is the same.
Risk of Unauthorized Access

If the VNC service is enabled on the instrument, any user in the network who knows the computer name and password can access it.

Disable the VNC service on the instrument to prevent unauthorized access.

Setting up a VNC connection

1. Connect the instrument and the remote computer to a LAN, see Chapter 2.6.1, "Connecting the Instrument to the Network", on page 32.

2. Install the Ultr@VNC application and enable it on the instrument.

3. In the ICF firewall, enable communication on the network via Ultr@VNC program. See “Configuring Internet Connection Firewall for VNC Connection” on page 44.

4. Install the VNC Viewer on the remote computer with Windows operating system, see "Installing the VNC Viewer on a Windows PC" on page 45.

5. Set up the VNC connection between the instrument and:
   a) the remote computer with Linux/Unix operating system, see “Setting up the VNC connection on the Linux/Unix remote computer” on page 46;
   b) the remote computer with Windows operating system, see “Setting up the VNC connection on the Windows remote computer” on page 46.

Enabled Direct Control

The direct control of the instrument is not disabled and the instrument can be controlled from the front panel and via the remote computer alternately.

Installing the Ultr@VNC application

1. Download the program from the internet and copy it to a directory that can be accessed.

2. On the instrument, shut down firmware using the ALT+F4 key combination.

3. Double click on the setup file to start the installation.
   The setup wizard leads through the installation. This description focus only on the relevant settings.
a) Select installation of all components.

![Select Components](image)

A successful installation is indicated by a message.

![WinVNC successful registration](image)

At the same time a warning is displayed stating that a password must be set.

![WinVNC Error](image)

b) In the "Additional Task Panel", enable all entries.

![Select Additional Tasks](image)

4. Select "OK".

The "Default Local System Properties" panel opens.
5. Enter a password with a length of at least five digits. This password is used on the remote computer to access the instrument. Other settings may be changed according to the user-specific security requirements.

After the installation the Ultr@VNC program is automatically started together with the operating system. On mouse over, the IP address of the instrument is indicated.

This IP address and the user-defined password are the prerequisites to enable remote access on the remote computer. Terminated connection is indicated by changed icon color.

Configuring Internet Connection Firewall for VNC Connection

To enable remote access of an instrument in a local network via VNC connection, the connection must be specifically permitted in the firewall.

1. Press the "Windows" key to access the operating system and select "Start > Settings > Control Panel > Windows Firewall" to open the "Windows Firewall".

2. Select "Exceptions > Add Program... > Run Ultr@VNC SERVER" and confirm with "OK".
3. In the "Exceptions" tab, enable "Run Ultr@VNC SERVER".

Installing the VNC Viewer on a Windows PC

1. Download the Ultr@VNC program form internet and follow the installation instructions.
   Only the program component VNC Viewer is required.
   **Note:** The VNC Viewer program is included in the download for the installation of the Ultr@VNC program on the signal generator if "Full installation" was selected in the "Select Component" panel. In this case, the program ultr@vncviewer.exe can be copied to the Windows PC.

2. Install VNC Viewer program component on the remote computer.
Setting up the VNC connection on the Linux/Unix remote computer

The VNC program is available per default for Linux/Unix operating systems.

1. Start a Web browser on the remote computer and enter the IP address of the instrument.

2. Enter the following address:
   \textit{vnc://<IP-address of the instrument>}, e.g. \textit{vnc://192.168.1.1}.
   A dialog is opened and the password for the remote VNC connection is requested.

3. Enter the password as defined in the "Default Local System Properties" panel of the Ultr@VNC program and select "Log On".

   The connection is established, the instrument is remote accessed and the current signal generator screen with the block diagram is displayed. The individual functions are operated using the mouse and keyboard.

   In contrast to remote access via Remote Desktop, the direct control of the instrument is not disabled and the instrument can be controlled from the front panel and via the remote computer alternately.

Setting up the VNC connection on the Windows remote computer

1. Start VNC Viewer program component on the PC, select "VNC Server" and enter IP address of the instrument.

2. To initialize the connection, select "Connect".

   A message requesting the password appears.

3. Enter the password as defined in the "Default Local System Properties" panel of the Ultr@VNC program and select "Log On".

   The connection is established, the instrument is remote accessed and the current signal generator screen with the block diagram is displayed. The individual functions are operated using the mouse and keyboard.
Enabled Direct Control
The direct control of the instrument is not disabled and the instrument can be controlled from the front panel and via the remote computer alternately.

Terminating VNC Connection
The remote access via VNC connection can be terminated either on the R&S SMATE or on the external PC. Terminating the connection does not disable it. It can be established again any time. See the notice above concerning unauthorized access due to VNC connection!

1. Terminate the connection on the R&S SMATE
   a) Press the "Windows" key to access the operating system.
   b) Right-click on the VNC icon on the task bar and select "Kill all clients".

2. To terminate the connection on the external Linux/Unix PC, close the internet browser or close the signal generator window.

3. To terminate the connection on the external Windows PC, close the VNC Viewer program.

   The connection is terminated. The color of the VNC icon in the status bar of the instrument changes.
   A message on the external PC indicates the disconnection.

Disabling Remote Access via Ultr@VNC
The VNC connection can be disabled by removing the program on the instrument or by deactivating the VNC Server service.

1. Remove the VNC program
   a) Press the "Windows" key to access the operating system and open the "Add or Remove Programs" by selecting "Start > Settings > Control Panel > Add or Remove Programs".
   b) Remove the VNC program.

2. Deactivate the VNC Server service
   a) Press the "Windows" key to access the operating system and open the "Services" by selecting "Start > Settings > Control Panel > Services".
   b) Deactivate the VNC Server service.

   The connection is disabled, the VNC icon disappears from the task bar of the instrument.

2.8 Using Virus-Protection Software
Virus-protection software Symantec Antivirus 10.1.7.7000 has been successfully tested for compatibility with the instrument software on R&S SMATE.
Preparing for Use

However, Symantec Antivirus may affect the behavior of the instrument in terms of settling time or stability. Symantec Antivirus 10.1.7.7000 has been subjected to detailed tests with R&S SMATE and a page file of 1024 MB. The system remains very reliable. However, rare impact on the settling time has been experienced (slight degradations of settling time in 2% of samples out of specification).

Preparing the Installation of Symantec Antivirus

The installation is performed in the operating system.

Accessing Operating System

The operating system can only be accessed if an external keyboard and/or a mouse is connected. Windows provides an on-screen keyboard that can be operated using a mouse, thus enabling operation by mouse only. An external keyboard is recommended for extensive entries.

1. Press the "Windows" key to access the operating system and open the "System" dialog by selecting "Start > Settings > Control Panel > System".
2. In the "System" dialog, select the "Advanced > Performance > Settings > Change".
3. Enable "Drive D: [DATA]" and "System managed size", confirm with "Set" and close the dialog.

The Symantec Antivirus program can be installed.

2.9 LXI Configuration

LAN eXtensions for Instrumentation (LXI) is an instrumentation platform for measuring instruments and test systems that is based on standard Ethernet technology. LXI is intended to be the LAN-based successor to GPIB, combining the advantages of Ethernet with the simplicity and familiarity of GPIB.
Like GPIB, LXI determines and standardizes the way the instrument behaves in a LAN. The LXI implementation by the Rohde & Schwarz signal generators allows you to change certain LAN settings, to reset the LAN connection as well as to easily identify the instrument.

**LXI classes and LXI functionality**

LXI-compliant instruments are divided into three classes, A, B and C, with the functionality of the classes hierarchically based one upon the other:

- **Class C** instruments are characterized by a common LAN implementation, including an ICMP ping responder for diagnostics. The instruments can be configured via a web browser; a LAN Configuration Initialize (LCI) mechanism resets the LAN configuration. The LXI class C instruments shall also support automatic detection in a LAN via the VXI-11 discovery protocol and programming by means of IVI drivers.

- **Class B** adds IEEE 1588 Precision Time Protocol (PTP) and peer-to-peer communication to the base class. IEEE 1588 allows all instruments on the same network to automatically synchronize to the most accurate clock available and then provide time stamps or time-based synchronization signals to all instruments with exceptional accuracy.

- **Class A** instruments are additionally equipped with the eight-channel hardware trigger bus (LVDS interface) defined in the LXI standard.

For information about the LXI standard refer to the LXI website at [http://www.lxistandard.org](http://www.lxistandard.org). See also "News from Rohde & Schwarz, article 2006/II - 190".

Instruments of classes A and B can generate and receive software triggers via LAN messages and communicate with each other without involving the controller.

The R&S SMATE complies with LXI class C and provides an integrated "LXI Status" dialog for LXI status indication and reset of the LAN configuration (LAN Configuration Initialize, LCI). To access the LXI Status dialog, press the SETUP key and select "Remote > LXI Status".

For further information, see section "LXI Status" in the Operating Manual.
Firmware update
After a firmware update, shut-down and re-start the instrument in order to enable the full LXI functionality.

Default state of the network settings
According to the LXI standard, an LCI must set the following parameters to a default state.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCP/IP Mode</td>
<td>DHCP + Auto IP Address</td>
</tr>
<tr>
<td>Dynamic DNS</td>
<td>Enabled</td>
</tr>
<tr>
<td>ICMP Ping</td>
<td>Enabled</td>
</tr>
<tr>
<td>Password for LAN configuration</td>
<td>LxiWebIfc</td>
</tr>
</tbody>
</table>

The LCI for the R&S SMATE also resets the following parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>&lt;Instrument-specific host name&gt;</td>
</tr>
<tr>
<td>Description</td>
<td>Vector Signal Generator</td>
</tr>
<tr>
<td>Negotiation</td>
<td>Auto Detect</td>
</tr>
<tr>
<td>VXI-11 Discovery</td>
<td>Enabled</td>
</tr>
</tbody>
</table>

The LAN settings are configured using the instrument's "LXI Browser Interface".

2.9.1 LXI Browser Settings

To access the instrument via the web browser:

- Type in the instrument's host name or IP address in the address field of the browser on your PC, for example "http://10.113.1.205".

  Note: Do not add the missing zeros in the IP address, while opening the instrument home page.

  The instrument home page (welcome page) opens.
The navigation pane of the browser interface contains the following elements:

- **"LXI"**
  - "Home" opens the instrument home page. The home page displays the device information required by the LXI standard, including the VISA resource string in read-only format.
  - "Device Indicator" activates or deactivates the LXI status indication. When activated, the LXI LEDs flash, both in the browser dialog and in the LXI dialog of the connected instrument. A green LXI status symbol indicates that a LAN connection has been established; a red symbol indicates that no LAN cable is connected.
  - "Lan Configuration" allows you to configure LAN parameters and to initiate a ping, see Chapter 2.9.2.3, "Ping Client", on page 54.
  - "Status" displays information about the LXI status of the instrument.
  - "Utilities" provides access to the LXI event log functionality required by the LXI standard.

- **"Instrument Control"**
  - "Web Control" provides remote access to the instrument, see Chapter 2.9.2.4, "Web Control", on page 55.

- **"Diagnostics"**
  - "SCPI Remote Trace" records messages exchanged via the remote control interface, see Chapter 2.9.2.5, "SCPI Remote Trace", on page 56.

- **"Help"**
  - "Glossary" explains terms related to the LXI standard.
Press the "INACTIVE (press to toggle)" button to activate the connection.

A green flashing status LED indicates the active connection. If the LAN connection fails, the LED turns red.  
The status of the LAN connection is also indicated by the "LAN Status indicator" in the "LXI Status" dialog and by the LXI status LED on the front panel of the instrument.  
For further information, see section "LXI Status" in the Operating Manual.

2.9.2 LAN Configuration

The "LAN Configuration" web page provides access to the parameters required for identifying the R&S SMATE in the network, and allows modification.

Password protection

Changing the LAN configuration is password-protected. The default password is Lxi-WebIfc (notice upper and lower case characters). This password cannot be changed in the current firmware version.

It comprises the following navigation entries.

- IP Configuration ........................................................................................................... 52  
- Advanced LAN Configuration .....................................................................................53  
- Ping Client .................................................................................................................. 54  
- Web Control ................................................................................................................ 55  
- SCPI Remote Trace .................................................................................................... 56

2.9.2.1 IP Configuration

The "IP Configuration" page displays all mandatory LAN parameters.
The "IP Address Mode" selects a configuration mode for the IP address of the R&S SMATE. With static configuration, the entered IP address, subnet mask, and default gateway are used. With dynamic configuration, DHCP or dynamic link local addressing (automatic IP) are used to obtain the instrument IP address.

2.9.2.2 Advanced LAN Configuration

The "Advanced Config" page provides LAN settings that are not declared mandatory by the LXI standard.
The following advanced parameters are available:

- "mDNS and DNS-SD": The additional protocols "multicast DNS" and "DNS service discovery" are used for device communication in zero configuration networks, working without DNS and DHCP.

- "ICMP Ping enabled": Must be enabled to use the ping utility. If you disable this setting, the instrument does not answer ping requests. The setting does not affect the LXI ping client. You can ping other hosts from the instrument, even if the setting is disabled.

- "VXI-11 Discovery": Must be enabled to detect the instrument in the LAN. If you disable this setting, the instrument cannot be detected by the VXI-11 discovery protocol mechanism. The setting does not affect other detection mechanisms. Setting up a VXI-11 connection via the IP address or the host name is independent of this setting.

### 2.9.2.3 Ping Client

The "Ping Client" page provides the ping utility to verify the connection between the LXI-compliant instrument and another device.

The ping is initiated from the instrument. Using the **ICMP** echo request and echo reply packets, the function checks whether the communication with a device via LAN works. Ping is useful for the diagnosis of IP network or router failures.

The ping utility is not password-protected.

To initiate a ping from the instrument to the device:

1. Enable "ICMP Ping" on the "Advanced LAN Configuration" page.
2. Select the "Ping Client" page.
3. In the "Destination Address" field, enter the IP address of the device to be pinged (without the ping command and without any further parameters), e.g. 10.113.1.203.

4. Select "Submit".

2.9.2.4 Web Control

The web control functionality provides remote operation via VNC using a Web browser (with HTML5). This mode does not require additional installation or activation. The VNC protocol allows simultaneous operation from several remote devices. The instrument remains locally operable.

The GUI of the R&S SMATE is visible. To perform the settings, you can operate the instrument as with the manual control. The instrument controls are available via the front panel simulation. File upload and download between the instrument and the remote PC is also available.

Starting a Remote Control via the LXI web browser

This section assumes that the instrument and the controller PC are connected in the LAN.

1. Start a web browser that supports html5 (W3C compliant).

2. Enter the IP address of the R&S SMATE in the browser's address bar.

   The R&S SMATE's welcome page is displayed.

3. In the navigation pane, select "Instrument Control" > "Web Control".

   Remote access to the instrument requires the password. The default password is instrument.

4. Enter the password and confirm with the ENTER key.

   After the connection is established, the current screen of the R&S SMATE is displayed in the browser window.
5. Use the mouse cursor and keyboard to access the functionality of the instrument as you would directly perform the settings on the instrument's front panel.

2.9.2.5 SCPI Remote Trace

The remote trace functionality allows you to trace input and output strings at the remote control interface of the R&S SMATE.

A recorded trace (message log) can be evaluated directly in the dialog. Use the highlighting and navigation functions provided in the lower toolbar to locate error messages and messages containing arbitrary search strings. You can also export the message log to a *.csv file and evaluate the file using a suitable program.

To trace and display messages:

1. In the navigation pane, select "Diagnostics" > "SCPI Remote Trace".

2. In the toolbar bar of the "SCPI Remote Trace" page, select "live mode" > "on" and "logging" > "on".

   "live mode > on" displays all commands and responses, and "logging > on" also traces messages.

3. If you now control the R&S SMATE with SCPI commands, using an appropriate tool, the SCPI remote trace records the information sent and received.

The function records all sent commands, received responses and messages, and stores them in an internal database. If "live mode" is disabled, you can display the recent traces upon request, using the "refresh" button. You can also store the log in a file.

Note: The diagnostics functionality will be extended in later releases, e.g. to download or upload SCPI command files from / to the instrument.
Toolbars

The toolbar at the top of the dialog provides basic settings and functions.

- "Live mode" / "logging": If logging is switched on, messages are traced. They are stored in an internal database and can be displayed upon request, using the refresh button (live mode off) or they can be displayed automatically (live mode on).
- "Filter": applies a filter to columns and/or rows when working (live mode off)
- "Refresh": reads the message log from the internal database and displays it
- "Download": stores the SCPI trace log to a *.csv file
- "Clear": deletes all message log entries in the database and on the screen
- "Details": displays details of the selected message, for example an SCPI command in hex format (also possible by double-clicking a message)

Columns

The following columns are available if no column filter is applied:

- "Rec": record number of the message within the message log
- I: number of the subinstrument
- "MT": indicates the type of the message. Possible values and related message contents are:
  - > = incoming command
  - < = outgoing response to a query
  - E = error message, highlighted by red color
  - T = execution time, i.e. time required by the instrument to process the command internally

- "message": indicates the type of the message. Possible values and related message contents are:
  - > = incoming command
  - < = outgoing response to a query
  - E = error message, denoted in red
  - T = execution time, i.e. time required by the instrument to process the command internally
3 Getting Started

This section helps you to get familiar with the R&S SMATE and provides an introduction to the general concept of the instrument with a sample of the possible application fields as well as a description of the main blocks in the signal generation flow.

This section also explains the operating concept in general and includes a brief introduction to operation by a step-by-step description of the configuration. The example is intended to provide a quick overview of the settings provided. No additional equipment is required.

3.1 Brief Introduction to the Instrument’s Concept

The R&S SMATE provides an entirely digital baseband section for generating I/Q signals and an RF section with I/Q modulator. The instrument uses I/Q (vector) modulation. Digital data streams are converted to an I/Q baseband signal. The baseband signal is then D/A-converted and modulated onto the target RF carrier frequency with the aid of an I/Q modulator.

The R&S SMATE may contain two paths; through the user documentation, the first being is called path A and the second path B, respectively.

The R&S SMATE is primarily intended to be remote-controlled via the GPIB interface or a LAN connection. Alternatively it is possible to control the instrument manually using an external monitor in combination with a mouse and keyboard or by accessing the instrument via the remote control desktop of an external PC.

In the following, the indications of the user interface on the external monitor are used to explain the functions of the vector signal generator.

For a detailed description of the blocks in the baseband and RF sections, refer to Chapter 3.3, "Baseband Section", on page 65 and Chapter 3.4, "RF Section", on page 67 respectively.

The operating concept of the R&S SMATE employs the following three ways of instrument control:

- Manual operation
- Remote control
- Remote access

Manual Operation

The architecture of the R&S SMATE and the signal flow can be displayed in a block diagram on an external monitor connected to the instrument.
The R&S SMATE is equipped with an intuitive user interface. The central element of the display is the block diagram that shows the signal flow and processing from the left on the display to most right, i.e. the generated signal can be seen at a glance.

The block diagram in the figure below shows a fully equipped instrument.

![Block diagram of a fully equipped R&S SMATE](image)

**Figure 3-1: Block diagram of a fully equipped R&S SMATE**

The instrument comprises a comprehensive info and help system. Context-sensitive help can be called any time with the HELP (F1) key. The help system indicates the currently selected parameter and offers additional services such as cross references, index and contents. The content of the help system corresponds to the operating manual of the instrument.

Warning and conflict messages caused by incorrect operation as well as further information are displayed in the "Info" line. A complete list of existing conflicts is displayed when the INFO (CTRL+I) key is pressed. Additional information on entries can be requested from the help system. The history function permits display of all messages.

Assistants simplify the completion of tables. After data entry in the assistant, the table is modified only after the "Accept" button has been pressed. Pressing the "Accept" button also stores the assistant data.

For an introduction into the manual operating of the instrument, detailed operating instructions and an overview of menus refer to Chapter 4, "Manual Operation", on page 77.

For an indepth description of the dialog boxes and the instrument functions refer to section "Instrument Functions" in the Operating Manual.

**Remote Control**

Remote control is an operation of the instrument by means of remote control commands or programs that automatize repeating settings. The instrument is connected to a computer running the program.
The R&S SMATE supports various remote control connections:

- Connecting the instrument to a (LAN) network
- Using the LXI browser interface in a LAN network
- Connecting a PC via the IEC-bus (IEEE 488) interface

**Tip:** For remote control over LAN, you can use the R&S VISA (Virtual Instrument Software Architecture) library provided for download at the Rohde & Schwarz website [http://www.rohde-schwarz.com/rsvisa](http://www.rohde-schwarz.com/rsvisa).

This way of operation and the instructions how to set up a connection for remote control are described in the operating manual, chapter "Remote Control Basics". The description of the remote control commands is provided in the operating manual, chapter "Remote Control Commands".

### Remote Access

Remote access is the operating of the instrument from a remote computer. Both the R&S SMATE and the computer are connected in a LAN.

Remote access in contrast to remote control does not use remote-control commands but a separate software which is installed on the remote computer. After its start, the software simulates the user interface of the instrument. The instrument can thus be operated from the remote computer as on the unit itself. The individual functions are operated using the mouse and keyboard. Specific instrument functions can be executed using specific key combinations on the keyboard or a front panel key emulation that can be operated with the mouse.

This way of operation and the instructions how to set up a connection for remote access are described in Chapter 2.7, "Remote Access via an External Controller", on page 36.

### 3.2 Applications of the Instrument

The modular design of the R&S SMATE allows the instrument to be equipped with two paths. This allows a multitude of applications to be performed for which several signal generators were previously required. A few examples are given below.

#### 3.2.1 Generation of digitally modulated signal

The main field of application of the R&S SMATE is the generation of digitally modulated signals. In the instrument, a digitally modulated signal can be generated in several ways.
Internally generated I/Q signal

The I/Q signal is generated internally in the R&S SMATE. One or two baseband generators can be installed. The signals produced by the two generators can be added (possibly with frequency offset).

In this case the instrument must be equipped with
- at least one baseband generator (option R&S SMATE-B10/B11)
- at least one baseband main module (option R&S SMATE-B13).

Analog Wideband I/Q operation

An external analog I/Q signal is directly applied to the I/Q modulator of the R&S SMATE. In this mode, the entire bandwidth of the I/Q modulator can be utilized. The various capabilities of the baseband section (AWGN, addition of signals, etc) are disabled, however.
3.2.2 Two Baseband Generators, One RF Path

Examples of the possible applications of an instrument equipped with two baseband generators and one RF path are:

- Addition of real time signals of different standards, e.g. GSM/EDGE and 3GPP FDD
- Generation of multicarrier signals with real time components
- Simulation of antenna diversity

Figure 3-3: Operation of I/Q modulator with external analog I/Q signals directly applied to the I/Q modulator

Figure 3-4: Operation of R&S SMATE with two baseband generators and one RF path
3.2.3 One Baseband Path and Two RF Paths

An example of the possible applications of an instrument equipped with one baseband path and two RF paths is:

- Generation of a modulated signal on path A and a CW interferer on path B.

3.2.4 Two RF Paths

Examples of the possible applications of an instrument equipped with two RF paths are:

- Combination of an external ARB signal on path A and a CW local signal on path B
- Combination of two external ARB signals, one on path A and one on path B
3.2.5 Fully Equipped Two-Path Instrument

Examples of the possible applications of a fully equipped two-path instrument are:

- Generation of a wanted signal and an interfering signal for receiver tests
- Generation of multicarrier signals with extremely wide bandwidth (>80 MHz)

![Figure 3-7: Fully equipped two-path instrument](image)

3.3 Baseband Section

The baseband section of the R&S SMATE is fully digital and contains the hardware for generating and processing I/Q signals.

The baseband section may contain two paths.

For detailed information on available options, refer to the R&S SMATE data sheet and the R&S SMATE configuration guide.

Baseband generator (option R&S SMATE-B10)

The generator produces baseband signals. It contains modules for real time signal generation and an arbitrary waveform generator (ARB).

The different baseband options feature a different ARB memory size (see data sheet). But apart from the memory size, all options have the same functionality and are installed alternatively.

One or two baseband generators can be fitted in an R&S SMATE and operated separately. Signals from the baseband generators can be routed from path A to B and vice versa, and added (possibly with frequency offset).
The option Baseband Generator contains real time Custom Digital Modulation and ARB. Software options providing various digital standards are offered in addition. Option R&S SMATE-K40, for instance, generates signals to GSM/EDGE standard, option R&S SMATE-K42 signals to 3GPP FDD standard.

**Baseband main module (option R&S SMATE-B13)**

The baseband main module can be installed twice, for each of both paths A and B respectively.

At the end of the baseband path, the digital signal is converted to an analog I/Q signal. The analog I/Q signal is fed to the I/Q modulator of the RF path. This module also routes signals to the analog I/Q outputs. The module is absolutely required for coupling out the baseband signal from the baseband section.

At this stage routing from A to B or vice versa is no longer possible. If a two-path RF section is available, two baseband main modules are required if the signals from the baseband section are to be output to the two RF paths.

This module also offers digital I/Q impairment functions. The I/Q signal can be deliberately corrupted, e.g. for testing the receiver quality.

**Additional White Gaussian Noise (option R&S SMATE-K62)**

Additive white noise, which may be required for instance for measurements on mobile radio base stations, can be produced with the AWGN software option (R&S SMATE-K62).

### 3.3.1 Description of Individual Diagram Blocks of the Baseband Section

The baseband section of the R&S SMATE comprises two paths (paths A and B). Therefore, if two baseband generators are available, two baseband signals can be processed independently of each other. Routing from path A to path B and vice versa is also possible, but not after the "IMP" or "AWGN/IMP" block.

Each function block can be activated or deactivated with the "ON" check box (on/off toggling).

A detailed description of the blocks is provided below.

**Baseband A block**

In this block, the (first) baseband source is configured and activated. The block is displayed only if a baseband generator is available in the instrument.

Depending on the installed software options, various digital standards, user-configured digital real time modulation or the built-in waveform generator (ARB) can be selected. The selected modulation is displayed in the block.
**Baseband B block**
Configures the second baseband source (if installed). The block is displayed only if the instrument contains two baseband generators. Depending on the installed software option, various digital standards, user-configured digital real time modulation or the built-in waveform generator (ARB) can be selected.

**Note:** If two baseband generators are installed and two signals of the same standard (e.g. GSM/EDGE) should be output simultaneously, the two associated software options must also be installed (in this case R&S SMATE-K40).
If only one R&S SMATE-K40 is installed and GSM/EDGE is selected in the first baseband generator, the second baseband generator is disabled for GSM/EDGE.
However, a software option is not tied to a specific baseband generator. In our example, either the first or the second baseband generator can output a GSM/EDGE signal.

**AWGN/IMP A block**
This block is displayed only if a baseband main module is installed.
In this block (digital) I/Q impairments for the baseband path can be set. With the aid of the software for AWGN generation (option R&S SMATE-K62), an (additive) noise signal can be produced.
AWGN and impairments can be activated independently of each other in the appropriate menus. The settings are displayed in the block. The entire block can be activated or deactivated. If the block is deactivated, the signal passes through the block unchanged.
In addition, the differential I/Q output is configured in this block (option R&S SMATE-B16).

**AWGN/IMP B block**
This block is displayed only if two baseband main modules (option R&S SMATE-B13) are installed. In this block (digital) I/Q impairments for baseband path B can be set. With the aid of the software for AWGN generation (option R&S SMATE-K62), an (additive) noise signal can be produced in path B.
If a noise signal should be applied to path A and B simultaneously, two software options R&S SMATE-K62 are required.

**Graphics block**
With this block, the baseband signal (of path A or B) can be graphically displayed in real time. The block is displayed only if at least one baseband main module is installed.

### 3.4 RF Section

The RF section of the R&S SMATE may also contain two paths.
An RF path is configured by installing a frequency option that comprises all required modules.
One of the following options must be installed.

Frequency options (Path A)
- R&S SMATE-B103 (up to 3 GHz)
- R&S SMATE-B106 (up to 6 GHz)

Frequency options (Path B)
- R&S SMATE-B203 (up to 3 GHz)
- R&S SMATE-B206 (up to 6 GHz)

RF path B can be I/Q-modulated only if the baseband section is equipped with two Baseband Main Modules R&S SMATE-B13.

In addition, each RF path can be equipped with
- high-power option for higher output levels (R&S SMATE-B31/B36)
- option FM/PhiM Modulator and Low Phase Noise (R&S SMATE-B20/B22)

For detailed information on available options, refer to the R&S SMATE data sheet and the R&S SMATE Configuration guide.

3.4.1 Description of Individual Diagram Blocks of the RF Section

This section gives an overview of the available blocks and a detailed description of their functions.

I/Q Mod A block

The (first) I/Q modulator is configured in this block. Also the Analog Wideband I/Q mode can be selected here, which allows external I/Q signals to be directly applied to the I/Q modulator, i.e. not via the baseband section. If no baseband modules are installed, I/Q modulation is possible only in the Analog Wideband I/Q mode.

I and Q components can also be swapped (I/Q Swap). (Analog) I/Q impairments can be set in addition. Unlike the impairments in the "AWGN/IMP" block, impairments in the "I/Q Mod" block also affect the externally applied signals in the Analog Wideband I/Q mode.

The status display in the block shows whether I/Q impairments and/or I/Q swap is active. I/Q modulation is switched on or off with the TOGGLE ON/OFF key.

Note: An I/Q modulator provided in the R&S SMATE is automatically activated when a connected baseband source is switched on. The I/Q modulator can also be separately switched on and off (select the "I/Q Mod" block and press the TOGGLE ON/OFF key). This permits the following configuration to be obtained with a single-path R&S SMATE. The baseband source generates an I/Q signal that is output via the analog I/Q output. At the same time, the RF section generates an unmodulated carrier.
I/Q Mod B block
This block controls the I/Q modulator of RF path B. It is displayed only if a second RF path is installed.

Note: The I/Q modulator B can be driven by modulation signals from the R&S SMATE baseband section or by external analog I/Q signals.

RF/A Mod A block
In this block, the RF parameters and the analog modulation modes of path A are set. The active analog modulation modes are displayed in the block. The TOGGLE ON/OFF key switches the RF signal on and off. When the RF signal is switched off, the switch before the RF output symbol is open.

RF settings include:
• Frequency and reference frequency
• Attenuator settings.
  If required, switching to the high-power mode if a high-power option is installed for path A.
• Frequency and level sweep
• List Mode settings. In this mode, extremely fast frequency and level settings can be made.

Note: Numeric values for frequency and level are entered best and quickest with the aid of the FREQ and LEVEL keys.

Available analog modulation modes:
• Amplitude modulation
• Broadband amplitude modulation
• Frequency modulation (option R&S SMATE-B20/B22)
• Phase modulation (option R&S SMATE-B20/B22)
• Pulse modulation.

Note: For modulation modes that can be simultaneously used, refer to the R&S SMATE data sheet.

RF/A Mod B
In this block, settings are made for analog modulation and RF parameters of path B. This block is displayed only if a second RF path is installed.

Available analog modulation modes:
• Amplitude modulation
• Frequency modulation (option R&S SMATE-B20/B22)
• Phase modulation (option R&S SMATE-B20/B22)
• Pulse modulation.

3.5 Example of Setup
This section provides an example on how to configure the instrument to generate and display a simple QPSK-modulated signal.
Configuring and displaying a QPSK-modulated signal

To generate and display a QPSK-modulated signal, proceed as follow:

1. Activate default (preset) state.
   - Press the CTRL+P combination on the external keyboard to set a defined instrument state.
   - SCPI command: *RST

2. Select and activate digital modulation
a) Use the cursor keys on the external keyboard and select the "Baseband A" block.
   SCPI command: n.a.

b) Press the ENTER key to open the menu where the digital modulation can be selected (different modulation modes are available depending on the options installed).
   SCPI command: n.a.
c) Use the cursor key to navigate and highlight "Custom Digital Mod...".

Press the ENTER key to open the "Custom Dig. Mod." dialog. SCPI command: n.a.

d) Use the cursor keys to navigate and to select parameter "Symbol Rate" and enter the preferred symbol rate with the aid of the numeric keys.

SCPI command: SOUR:BB:DM:SRAT 10MHz
e) Use the cursor keys to navigate and to select parameter "Coding". Press ENTER to open the selection list. Use the cursor keys to select "Off" and press ENTER to activate the selected item. SCPI command: SOUR:BB:DM:COD OFF

g) Finally, select "State" and press ENTER to switch on the digital modulation. SCPI command: `SOUR:BB:DM:STAT ON`

To indicate the active state, the "Baseband" block is displayed in blue.

h) Press the CTRL+D key combination to display the complete block diagram. SCPI command: n.a.
i) The entry in the "Winbar" indicates that the "Custom Dig. Mod." menu is still open in the background. 
To display the menu in the foreground, press the ESC key.

Press the CTRL+H key combination to minimize the menu again.
Press the ESC key again to close the dialog.
SCPI command: n.a.

The "I/Q Mod" block is automatically activated.
The "RF/A Mod" is not yet active, which means that no RF signal is output.

3. Set frequency and level and activate RF signal

a) Press the CTRL+F key combination to activate the editing mode for frequency entry. The "Frequency" entry field in the header section of the display is highlighted.

Enter the frequency using the numeric keys and terminate the entry by pressing the ALT+F9 key combination for unit GHz.
SCPI command: SOUR:FREQ 2E9

b) Press the CTRL+L key combination and enter the level settings in the same way.
SCPI command: SOUR:LEV -5dBm

c) Press the CTRL+D key combination to display the complete block diagram.
d) Select the "RF/A Mod" block and activate it.
SCPI command: OUTP:STAT ON

The QPSK modulation signal is now present at the RF output.
4. Select graphics display of I/Q signal
   a) Select the "Graphics" block and open the respective menu.
   b) Select "State On" to activate display of the I/Q diagram.
4 Manual Operation

The following chapter describes the manual control of the R&S SMATE is provided even though the instrument is primarily intended to be remote-controlled via the GPIB interface or a LAN connection. Manual control using an external monitor, mouse and keyboard or from an external PC via a network link might help the user to get familiar with the instrument.

The examples within this description focus on manual operation from an external monitor with an external keyboard connected to the instrument.

The introduction into remote control is provided in Chapter 5, "Remote Control Basics", on page 117.

The R&S SMATE can be operated manually either via the interactive block diagram or via a menu tree. All menus are in the form of windows that can be operated in the same way. Key combinations on the external keyboard or alternatively a mouse allow direct access to entries and settings.

A key emulation menu can be accessed from the operating system (see Chapter 4.1.2, "On-screen Keyboard", on page 79). Thus, only operation via mouse is possible. This is supported by an R&S SMATE specific key emulation that emulates the front panel function keys of the R&S®SMU200A. The R&S SMATE-specific key emulation is called by a right-click of the mouse. For an overview of the key combinations, refer to Chapter 4.1, "Legend of Manual Controls", on page 77.

This section describes the concept of manual operation of the signal generator. This includes a description of the general structure of a dialog box, working with dialog boxes and the block diagram and the setting of parameters.

For an in-depth description of the dialog boxes and the instrument functions refer to section "Instrument Functions" in the Operating Manual.

4.1 Legend of Manual Controls

The following table lists all available key combinations used on the PC keyboard to trigger functions on the instrument. Keyboard labels are described in alphabetical order.

In addition, a front panel key emulation and an on-screen keyboard can be used for manual operation by mouse only.

<table>

### 4.1.1 Front Panel Key Emulation

The R&S SMATE provides a front panel key emulation to enable execution of the front panel key functions by mouse e.g. for remote access. The emulation is called on the external monitor by a right mouse click. The front panel key functions are executed by a mouse click on the associated button.

### 4.1.2 On-screen Keyboard

In addition, the Windows XP operating system provides a keyboard emulation that can be used for system settings if no external keyboard but a mouse is available.

To access the on-Screen Keyboard, select "Start > Programs > Accessories > Accessibility > On-Screen Keyboard".
4.2 Key Features

The manual operating concept of the R&S SMATE enables the user to make settings as intuitively as possible and at the same time gives a permanent overview of characteristics of the generated signal and of the current instrument state. Numerous online help functions support user settings.

Block diagram

The block diagram is the core of the operating concept.

A graphics display shows the current configuration and the signal flow in the form of a block diagram. All graphical elements can be accessed for operation. An element is selected by means of the arrow keys and the associated setting function is called by pressing Enter. Required menus and graphs are displayed on the block diagram which is displayed again in the foreground whenever the DIAGRAM (CTRL+D) key is pressed.

Permanent frequency and level display

The main characteristics of the RF signal, frequency and level, are permanently displayed in the header section of the screen and can be directly set in the display fields after the FREQ (CTRL+F) or LEVEL (CTRL+L) key is pressed. Status messages for the output signal are displayed in addition to frequency and level.

Operation via Graphical User Interface

- Functional blocks
  
  Menus are assigned to the specific function blocks in the block diagram. The function blocks represent elements of signal generation. Function blocks displayed with a blue frame can be directly switched on and off by means of the TOGGLE ON/OFF (CTRL+T) key. The menus of the highlighted function blocks can be called by pressing the ENTER key.
  
  Example:
  
  The "Baseband" block contains all menus required for baseband signal configuration.
In this block all digital standards and the digital modulation can be selected.

- **Signal flow**
  The signal flow between the function blocks and the employed inputs and outputs are also shown.

- **Menu tree**
  The menu tree can be opened and closed with the MENU (CTRL+M) key. The menu tree is organized in the same way as the directories under Windows. The function blocks correspond to the first directory level, the menus to subdirectories.

**Operation corresponds to the Windows concept**

To offer the user a familiar environment, operation is very similar to operation of Windows user interfaces. All menus and tables are made up of known elements, such as selection lists, check boxes and entry fields.

A blue frame indicates that the selected item is active. In the highlighted element, entries can be made.

**Clear settings with the aid of independent subdialogs**

A separate window is opened for each dialog and subdialog. The dialogs can be operated independently of each other, i.e. none of the dialogs requires that settings in other dialogs be completed before it can be closed. This ensures flexible operation at all times.
Winbar

The Winbar gives an overview of menus and simplifies their access.

The menus are displayed on top of the block diagram but they can be “hidden” with the aid of the HIDE (CTRL+H) key, i.e. displayed in the form of a button in the "Winbar" at the lower end of the screen.

They can be displayed again in full size by a keystroke (REARR (CTRL+A) key). This makes room on the screen for other displays that may be required but the setting menus can be still accessed any time.

Keys with assigned simple functions

Most key combinations directly perform a simple function.

Since a great number of settings can thus be made by a keystroke, operation is easy. For instance, the CLOSE (ESC) key closes the active menu; with the RF ON/OFF (CTRL+R) key the RF output signal can be switched on or off.

An exception are keys that call a menu such as the MENU (CTRL+M) key which opens the complete menu tree of the instrument, the SETUP (CTRL+E) key which opens the menus for general instrument settings or the FILE (CTRL+S) key which opens the menu for file management.

Help functions for user support

Numerous help functions support the user in signal configuration.

• Value ranges

The valid setting range is displayed for each numeric parameter. This requires a short wait after activation of the entry field. The range is then displayed automatically after a few seconds.

If the entered value is outside the permissible range, the next permissible value is automatically set and a message is output.

• Context-sensitive help

Context-sensitive help for each parameter can be called with the HELP or F1 key.
Comprehensive online help
Each help page is part of a comprehensive online help function which can be called by means of an index, a content tree or the "Previous/Next" buttons.

Info line with messages for indication of the current instrument state
A great variety of different messages such as status messages, error messages, warnings or information are displayed in the header field of the screen. With the aid of the INFO (CTRL+I) key, help pages can be called for most of the messages. They provide background information on the message and indicate operating steps that may be required. All messages are explained in the online help which can be called with the HELP (F1) key.

Graphical display of data structure
The structure of the baseband signal is graphically displayed in the respective menus; the individual signal elements can be graphically selected for processing.

Graphics editor for definition of control signals
Control signals are also graphically configured.
Graphical display of output signal in a diagram

The output signal can be graphically displayed in a number of diagrams. This allows a fast check of signal characteristics. Zoom functions and the insertion of a reference trace permit in-depth evaluation without an external analyzer being required.

4.3 Display

The display shows the current signal generator state and offers graphical elements for direct operation. It is divided into three sections:

- The frequency and level display with info line indicates the main output signal parameters and reports the current state with status, error and warning messages.
- The block diagram shows the instrument configuration, the signal characteristic as well as the inputs and outputs used and permits interactive operation via graphics elements. Active menus and graphs are displayed on top of the block diagram.
- Winbar with labeled softkeys for menu display.

The block diagram in the figure below shows a fully equipped instrument.
4.3.1 Settings Displayed in the Header Section

Frequency/level settings and a few status messages (see Chapter 4.3.2, "Status Information and Messages", on page 85) are displayed in the header field of the screen. The display may vary depending on the instrument's operating mode:

- In the case of two-path instruments, the RF information for the two paths is displayed in two lines.
- In the sweep mode, the current frequency or level of the output signal is displayed. The status message "SweepMode" is displayed in the info line.
- In the list mode, neither the current frequency nor level is displayed, the indication is dimmed.
- If user correction is active, the status message "UCorr" is displayed in the info line.
- In the case of digital modulation, "Freq" indicates the frequency, "PEP" the peak envelope power and "Level" the average level.

The values displayed in the "Freq" and "Level" fields include a set offset or multiplier factor.

See also "RF Frequency and Phase" and "RF Level" in the Operating Manual.

4.3.2 Status Information and Messages

The instrument indicates status information and messages in the header section of the screen. The messages differ with respect to their importance (errors, warnings, info) and the time of their appearance (brief and permanent messages), and require different treatment.
For additional information refer to the info window (see Chapter 4.3.3, "Info Window", on page 87).

Refer to "Error messages" in the Operating Manual for an overview of all status information and messages and corrective actions.

### 4.3.2.1 Status Information

The status information gives the user an overview of the main operating states and settings of the instrument. The states are indicated for information only and do not necessitate any action by the user.

Status information is displayed between the frequency and level fields, at the left of the info line or in the info line itself.

On two-path instruments, all states that can occur independently in the two paths are displayed separately for each path. The associated path is indicated in the info line.

#### 4.3.2.2 Messages

Messages indicate errors in the instrument. They are displayed in the info line in different colors depending on their importance and display duration. Errors (e.g. no calibration data) are displayed in red, information (e.g. file not found) and warnings in black. Warnings indicate less significant errors (e.g. the instrument operates outside specified data).

#### 4.3.2.3 Volatile messages

Brief messages report automatic settings in the instrument (e.g. switching off of incompatible types of modulation) or on illegal entries that are not accepted by the instrument (e.g. range violations). They are displayed in the info line on a yellow background. They are displayed on top of status information or permanent messages.

Volatile messages do not normally demand user actions and disappear automatically after a brief period of time. They are stored in the history, however.

These messages can be read from remote using `SYST:ERR?` or `SYST:ERR:ALL?`.

#### 4.3.2.4 Permanent Messages

Permanent messages are displayed if an error occurs that impairs further instrument operation, e.g. a hardware fault. The error signalled by a permanent message must be eliminated before correct instrument operation can be ensured.
The message is displayed until the error is eliminated. It covers the status display in the info line. After error elimination, the message automatically disappears and is also recorded in the history.

These messages can be read from remote using SYST:SERR?.

### 4.3.3 Info Window

A few operating states and the current message are displayed in the info line.

The INFO window with a list of current permanent messages and a detailed description of each message can be opened with the INFO (CTRL+I) key.

The upper section of the info window contains a list of all current permanent messages in the order of their occurrence, i.e. the most recent message is displayed first. In the lower section of the window, additional information on the highlighted message is displayed. A history of all messages that have occurred since instrument switch-on can be called with the "History" key. The most recent message is displayed first.

The messages are color-coded according to their level. Device-specific messages are red, info and remote control error are black. The level is also indicated in the "Lev" column (Err, Sys or Info). Column "SCPI" indicates the SCPI error code.

With the aid of the softkey buttons, error messages can be cleared and a history of all messages called.

**Delete**

Clears the highlighted message.

This button is available only if the history of the messages is displayed.

**Delete All**

Clears all messages.

This button is available only if the history of the messages is displayed.

**Del. volatile**

Clears all volatile messages.

This button is available only if the history of the messages is displayed.
Remote command:
SYST:ERR:ALL?
Each time a SYST:ERR:ALL? query is sent, the error queue is returned and at the same time cleared.

History
Calls the list of all messages that have occurred since instrument switch-on. The most recent messages are displayed at the top of the list. When the button is pressed again, the list of current messages is displayed.
Remote command:
SYST:ERR? or STAT:QUE?
Each time a SYST:ERR? or STAT:QUE? query is sent, the oldest entry in the error queue is returned and at the same time cleared in the list.

4.3.4 Block Diagram
The block diagram shows provided options, signal configuration and the currently selected signal flow of the generator with inputs and outputs used. Signal generation can be completely operated from the block diagram. The highlighted function block can be directly switched on and off with the TOGGLE ON/OFF (CTRL+T) key. Pressing the Enter opens the associated setting menu.

![Block diagram of the R&S SMATE](image)

Figure 4-2: Block diagram of the R&S SMATE

4.3.4.1 Function Blocks in the Block Diagram
Each block represents a function of signal generation. The function is indicated in the headline of the block. In the check box, the respective function can be quickly activated/deactivated with the TOGGLE ON/OFF (CTRL+T) key. After activation, the block is displayed in blue. Status information is displayed below the check box. It is different for the different blocks.
Pressing the Enter key opens the associated setting menu.
In all function blocks where the signal flow can be influenced, the top menu level for setting signal routing parameters is offered.

**Example: Baseband block**

![Baseband Block Diagram]

In this block, the digital modulation signal, the digital standards, arbitrary waveform generation and multicarrier CW are set. The status information of the "Baseband" block indicates the selected modulation and associated additional information, e.g. the number of channels.

### 4.3.4.2 Signal Flow and Input/Output Symbols in the Block Diagram

The input/output symbols in the block diagram show the currently used inputs and outputs of the signal generator. Unused inputs and outputs are not shown. The lines indicate the signal flow.

Symbols and labels refer to the corresponding inputs and outputs on the front and rear panel of the signal generator. The direction - input or output - is indicated by an arrow.

**Example:**

![I/Q Mod Block Diagram]

The symbols indicate the inputs for the analog I and Q signal.

In case of configurable user inputs/outputs, the name and the current assignment are indicated: Marker signals 1 to 3 of the two paths are assigned to fixed output User 1 interface, configured as output for the clock signal of path B.

If several markers are active, the marker characteristics are listed next to the marker symbol of the active markers.

Symbols and lines are displayed in different colors depending on their function.
The baseband signal is indicated by a three line arrow, the I- and Q-components of the signal by a single-line arrow.

Addition of signals is indicated by the summation sign.

Connections are indicated by a "solder point".

Black is used for the generated signal.

Green is used for control signals.

The signal flow is configured in the individual menus. User interfaces are configured in:

- the "Setup > USER Marker /AUX I/O Settings" dialog and
- the "Setup > Global Trigger/Clock/External Inputs" dialog.

4.3.5 Winbar and Softkeys

The "Winbar" is displayed below the block diagram. Labelled buttons represent open menus, the label indicates the menu. If several menus are open, the open, the button of the currently active menu is displayed in a lighter colour. The buttons also assign functions to the softkeys of the next lower level for front-panel operation. Up to eight menus may be open simultaneously. When the ninth menu is opened, the menu that was opened first is automatically closed.

Some menus, e.g. data and list editor menus, cover the "Winbar" and assign menu-specific functions to the front-panel softkeys by way of the menu buttons.

Any of the open menus can be activated either with the respective button in the "Winbar" or the front-panel softkey. In combination with the keys for menu operation (CLOSE (ESC), HIDE (CTRL+H) and REARR (CTRL+A)), convenient menu operation can be ensured.

Working with menus and dialog boxes is described in Chapter 4.4, "Accessing Dialogs", on page 92.

4.3.6 Structure of the Dialogs

The parameters are set in the menus. Menus are accessed either via the function blocks in the diagram or by means of the MENU (CTRL+M) key. The menus are displayed on top of the block diagram.

If the menu buttons assign menu-specific functions to the softkeys, the "Winbar" is hidden.
Working with menus and dialog boxes is described in Chapter 4.4, "Accessing Dialogs", on page 92; the setting of parameters in Chapter 4.5, "Setting Parameters", on page 93.

The menus are in Windows format. The menus differ in details depending on their function but they consist of the same main elements. Each menu consists of a menu header and one or more menu areas with various fields for setting parameters.

The header line contains the name of the menu and the buttons for minimizing and closing the menu. To operate the buttons, use the mouse or the front keys HIDE (CTRL+H) and CLOSE (ESC).

Several fields of associated but separately set parameters are organized in menu areas. A menu area is framed and labelled with the function common to all parameters.

Example: Impairments

```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>I Leakage</td>
<td>0.00</td>
<td>%</td>
</tr>
<tr>
<td>Q Leakage</td>
<td>0.00</td>
<td>%</td>
</tr>
<tr>
<td>Imbalance</td>
<td>0.00</td>
<td>%</td>
</tr>
<tr>
<td>Quadrature Offset</td>
<td>0.00</td>
<td>deg</td>
</tr>
</tbody>
</table>
```

Each of the setting fields is assigned a parameter name. The kind of setting varies depending on the parameter to be set. Some settings can only be made in a specific configuration. If setting is not permitted with the specific configuration selected, the respective item is disabled and displayed in gray and the entry or selection field cannot be accessed.

4.3.7 Graphical Display of Output Signal Characteristics

The graphical display of the output signal enables the user to rapidly check signal characteristics without connecting an analyzer. Zoom functions and the display of a reference trace allow in-depth evaluation. The diagram is displayed on top of the block diagram. It can be minimized and called in the same way as a menu.

Example: I/Q diagram
To access the "Graphics Settings" dialog for selecting the graphics display of the output signal, select the "Graphics" function block in the diagram or press the MENU (CTRL+M) key.

Operation of the graphics windows is analogous to menu operation.

The menu and the individual graphical displays are described in "Graphics Display" in the Operating Manual.

4.4 Accessing Dialogs

The MENU (CTRL+M) key opens the complete menu tree. Selecting a functional block and pressing the ENTER key opens the menu associated with this block.

An alternatively way to access a dialog is to use the Winbar buttons or front-panel soft-keys or to use the HIDE (CTRL+H), CLOSE (ESC), DIAGRAM (CTRL+D) and REARR (CTRL+A) keys on the front panel.

For a quick access to the dialogs, use one of the following alternative methods.

Displaying the block diagram or a dialog in the foreground

1. Press the DIAGRAM (CTRL+D) key to move the cursor to the block diagram.
   All active menus are minimized and displayed in the form of Winbar buttons.

2. Press the associated softkey (CTRL+F1 .. F8) to display the dialog in the foreground again.

Accessing the menu tree

► Press the MENU (CTRL+M) key to open the complete menu tree.

Calling the File, Setup or Hardcopy dialogs

► Use the FILE (CTRL+S), SETUP (CTRL+E) or HCOPY (CTRL+Y) keys to open the respective dialog.

Minimizing an active menu

► Use the HIDE (CTRL+H) key to minimize an active menu.
   It is displayed in the form of a Winbar button.

Automatically arranging displayed menus

► Press the REARR (CTRL+A) key to rearrange all open menus so that they overlap as little as possible.
4.5 Setting Parameters

The R&S SMATE offers several and sometimes alternative possibilities for setting parameters. Manual operation is possible with the aid of a mouse and/or from an external keyboard.

Most of the parameters are set in the different menus. The R&S SMATE provides alternative ways for accessing the dialogs. Use the arrow key on the external keyboard and navigate to the corresponding block in the block diagram and press Enter to open the dialog or perform a mouse click on the "Config..." button.

An exception are the "Setup", "File" and "Hcopy" dialogs. In the "Setup" dialog, general settings are made which are not directly concerned with signal generation, e.g. setting of the GPIB-bus address. In the "File" dialog, files and lists are managed; in the "Hcopy" dialog, printout is configured and hardcopies can be made. These menus can
only be called with the SETUP (CTRL+E), FILE (CTRL+S) and HCOPY (CTRL+Y) keys.

Frequency and level are directly set in the header area of the display using the FREQ and LEVEL keys.

Specific settings can also be made directly in the block diagram, e.g. activating a function block by means of the TOGGLE ON/OFF (CTRL+T) key or switching the RF output on and off with the aid of the RF ON/OFF (CTRL+R) key. Changes affecting the signal flow are immediately visible in the graphics display.

The R&S SMATE uses the Windows Embedded Standard operating system. Settings at system level are only rarely required, for example installation of a new printer driver. For convenient operation, a keyboard and a mouse are required.

This section provides an information about the parameter handling that comprises of the following main steps:

- Chapter 4.5.1, "Working with the Cursor", on page 94
- Chapter 4.5.2, "Selecting a Control Element", on page 95
- Chapter 4.5.3, "Switching Parameters On/Off", on page 95
- Chapter 4.5.4, "Entering a Value", on page 95
- Chapter 4.5.5, "Working with Units ", on page 97
- Chapter 4.5.6, "Selecting a Value from a List", on page 98
- Chapter 4.5.7, "Terminating Entries with Confirmation", on page 98
- Chapter 4.5.8, "Restoring the Previous Value", on page 99

4.5.1 Working with the Cursor

After the instrument is switched on, the cursor is always on the first function block of the diagram (default setting).

Moving the cursor on the display

To move the cursor, use one of the following alternative methods:

a) Use the arrow keys on the external keyboard.

b) Use the appropriate softkeys (CTRL+F1..F8) to move the cursor to the "Winbar". If the "Winbar" is covered by a menu, press the WINBAR (CTRL+W) key to display it in the foreground.

c) Use the ESC key.

Tip: Be aware that the function of the ESC key depends on the current cursor position. The function of this key depends on the current cursor position.

- Calls the next higher selection level.
- Closes the open window without accepting new entries; the old value or parameter is retained.
- In dialog boxes that contain a "Cancel" button it activates that button.
- Closes all kinds of dialog boxes, if the edit mode is not active.
• Quits the edit mode, if the edit mode is active.
• Switches between different entry fields of a menu.
• Shifts the entry cursor from the header display to the previously active menu, or to the previously highlighted block in the block diagram if no menu is active.
• Shifts the cursor from a function block in the diagram to the first item in the "Winbar". If no menus are open, the current cursor position remains unchanged.

Moving the cursor to the heading area
► Press the FREQ (CTRL+F) or LEVEL (CTRL+L) key to move the cursor to the header area.

4.5.2 Selecting a Control Element

Control elements are always selected in the same way no matter whether a function block in the diagram, a menu in the menu tree, a parameter in the menu or an entry in a list or table is concerned.

► To activate an element, put the cursor on it.

An active element is highlighted by a blue frame.

4.5.3 Switching Parameters On/Off

A parameter can be activated and deactivated using a button or a check box.

1. Select the parameter.
2. To change the state of a parameter, use the "Enter" function of the different control media:
   ● Press ENTER
   ● Press the TOGGLE ON OFF (CTRL+T) key.

   Colour and label of a button change, the check box is ticked or the tick is removed.

4.5.4 Entering a Value

Numeric and alphanumeric values can be edited in the entry fields. In the editing mode, cursors of different colour are used. A blue cursor indicates the overwrite mode, a green cursor the insert mode.

Numeric and alphanumeric values can either be newly entered or the existing value can be changed. Incorrect entries are cleared with the BACKSPACE key.
Entering a new numerical value
1. Select the parameter.
2. Press a numeric key to activate the editing mode.
   The previous value is cleared and the new value can be entered.

Editing a value in the insert mode (default setting)
1. Press the Enter key to activate the editing mode.
   If the cursor is placed at the right of the total value, the insert mode is always active.
2. Set the cursor to the left of the number to be changed using the LEFT/RIGHT arrow keys.
   The cursor is displayed in green.
3. Click on a numeric key to insert a new value.

Editing a value in the overwrite mode
1. Activate the editing mode.
2. Set the cursor on the numeric digit to be changed using the LEFT/RIGHT arrow keys.
   The cursor is displayed in blue and the number to be replaced is highlighted.
3. Click on a numeric key to overwrite the highlighted value.

Varying a value
1. Activate the editing mode.
2. Set the cursor to the left of the number to be changed using the LEFT/RIGHT arrow keys.
   The value at the cursor position is varied.
3. To vary the selected value, use the UP/DOWN arrow key.
   The value is increased or decreased.

Entering a new alphanumerical value
1. Select the parameter.
2. Press an alphanumeric key to start the editing mode.
   The new value is entered.
Editing an alphanumerical value

An existing value, e.g., a file name, can be changed in the insert mode (see example) or in the overwrite mode.

1. Select the parameter and activate the editing mode.
2. Set the cursor to the left of the alphanumerical value using the LEFT/RIGHT arrow keys.
3. Click on an alphanumeric key to insert a new alphanumerical value.

Terminating the entry of a numeric value

To terminate the entry of a numeric value:

1. Press the Enter key.
2. Press a unit key combination, e.g., ALT+F10, to assign a unit.
3. Select a "Unit" in the selection field next to the parameter value.

4.5.5 Working with Units

The unit of a parameter is displayed next to the value. When the parameter is edited, the unit is selected either from the list or by means of the front-panel keys. When the entry is completed, the unit can be changed. In this case the value remains unchanged but is automatically adapted to the new unit.

While operating the instrument by means of a mouse, assign the unit to the selected parameter before entering its value.

Assigning a unit

To assign a unit to a value, use one of the following alternatives:

1. Press a unit key combination, e.g., ALT+F10, on the external keyboard.
2. Select a "Unit" in the selection field next to the parameter value.

Changing a unit

To subsequently change a unit, i.e., after the entry has been terminated and when the editing mode is not active, use one of the following alternatives:

1. Press a unit key combination, e.g., ALT+F10, on the external keyboard.
2. Select "Unit" in the selection field next to the parameter value.

The value remains unchanged but the display is automatically adapted to the new unit, i.e. the value is recalculated to suit the new unit.

The new unit is indicated in the value field of the menu.

### 4.5.6 Selecting a Value from a List

Selection lists provide a list of predefined values for the selected parameter.

To select an item from a list, proceed as follows:

1. Press ENTER key to open the list.
2. Use the UP/DOWN arrow keys on the external keyboard to navigate through the list.
3. To confirm the selection, press the ENTER key.

### 4.5.7 Terminating Entries with Confirmation

The instrument behaves different by the termination of entries deppending on the parameter type and the way this parameter is set.

#### Confirming settings

- To confirm the settings, press the Enter key or select an unit (ALT + F9 or +F10 or +F11 or +F12).

See also Chapter 4.5.5, "Working with Units ", on page 97.

**Note:** Variations by means of arrow keys are immediately set.

#### Confirming multiple values

In some cases, like for instance when configuring the carriers for a multicarrier CW signal in a carrier table, it is useful first to enter few values and to confirm them together. Such settings require additional confirmation. Not yet confirmed settings are displayed on a yellow background as an indication that the currently displayed values do not represent the target signal.

- To confirm these settings, select the "Accept" button.
Confirming parameters with On/Off state

Most of the instrument functions with enabled and disabled states are calculated and effective only after these functions have been enabled. However, there are functions like the frequency variation of the reference oscillator for instance, that are immediately set after confirmation.

► To confirm a parameter with On/Off state, enable the parameter.

If time-consuming calculations are required, signal generation is automatically switched off and calculation is interrupted to allow the user to make further settings. Calculation is restarted with the RECALCULATE key and the modulation is switched on again when the calculation is completed.

Preventing recalculation

If an instrument function requires several parameter settings, switch the function off to prevent a recalculation.
Enable the function after the entire configuration of the settings have been completed. The signal is recalculated only once.

4.5.8 Restoring the Previous Value

Normally, values cannot be restored in the case of mouse control because no explicit confirmation is required in this case and entries are automatically confirmed when the entry or selection field is exited.

Restoring values

In the case operation from the keyboard, previous values can be restored as long as the new value is not confirmed, i.e. the entry is not completed.

► To restore the values, press the ESC key.

Restoring values that require confirmation

All settings that are not confirmed with the "Accept" button but require this additional confirmation can be restored.

1. Press the ESC key.
   A confirmation query is displayed.
   
   ![Warning dialog]

   You changed some parameter(s) which require a new calculation of the signal.
   Do you really want to abort your changes without ACCEPT?

   OK Cancel

   2. Confirm with "OK" to abort the changes.
Select "Cancel" to return to the dialog. The previous selected settings are displayed.

**Restoring values after an extended calculation has been started**

Calculation and setting might require different period of time. Many settings are made without noticeable calculation times; such operations are indicated by a "BUSY" message displayed in the status field of the header section.

A window with a progress indicates that the instrument performs an extended calculation that requires longer calculation time. The termination of such a calculation restores the previous values.

- Press the ABORT button to terminate the calculation.
  All previous values are restored.

### 4.6 Editors

The R&S SMATE provides user-friendly editors for defining data lists as well as control and marker signals. Lists containing frequency and level value pairs are used for the list mode and the user-defined level correction.

Internally generated data lists can be used for digital modulation and digital standards; the same applies to internally defined control and marker signals.

The lists are saved to files and may thus have any length. The file name of the lists and the directory to which the files are saved are user-selectable. The file prefix is different for each list type and is permanently assigned by the system.

For information about file handling and overview of the automatically assigned file prefixes, refer to Chapter 4.8, "File Management", on page 109.

#### 4.6.1 Working with List Editor

The "User Correction" and "List Mode" dialogs provide a list editor for defining the frequency/level value pairs.

**Editing list mode data lists**

1. To access a list editor and open an existing data list for editing, use the cursor keys to select the associated button "Edit User Correction Data..." or "Edit List Mode Data..." (if available) in the individual menu.

   The selected list is displayed and the cursor marks the first row of the "Frequency/Hz" column.
If no list has been selected, a blank list of only one row is displayed.

2. Press the LEFT/RIGHT arrow keys to change between the columns.
   Use the UP/DOWN arrow keys to mark a row.

3. Use the numeric keys to enter the value for the value pairs in the "Frequency/Hz"
   and "Power/dBm" table columns. A blank row is inserted at the end of the list.

4. To select a row, select the "GoTo" button and press the ENTER key.
   Use the numeric keys to enter the row index in the entry field and press the
   ENTER key to confirm the entry.
   The cursor moves to the selected row.

5. To insert a new row in the table, select the row above which the new row is to be
   inserted and select "Insert Row(s)".
   A row is inserted above the currently marked row.
   If no row has been selected, a row is inserted at the beginning of the list.

6. Use the "Save"/"Save As..." function to save the edited list under its current name
   or under a new name.
   Enter the file name in the "File Select" dialog and select the directory (see Chapter
   Only complete value pairs are taken into consideration; rows containing an entry in
   only one column are ignored.

**Creating a new list mode data list**

A new list can be created under a new name either by generating a blank file in the
"File Select" menu (see section Chapter 4.8, "File Management", on page 109) or by
changing an existing list which will then be saved under a new name.

1. To create an empty data list, select "RF > List Mode > List Mode Data... > New
   List" or respectively "RF > User Correction > User Cor. Data... > New User Correc-
   tion Data" and enter the file name of the new data list.
2. To open the data list for editing, select the associated button "Edit User Correction Data..." or "Edit List Mode Data..." in the individual menu. Edit the list and save it under a new name.

4.6.2 Working with Data Editor

The "Data Editor" is used to internally generate binary data lists for digital modulation and digital standards.

A list of binary values with a maximum length of $2^{31}$ bits can be entered in the "Data Editor". This value corresponds to a file size of approx. 268 Mbyte. While it is being processed, the file is continuously automatically buffered. When the dialog is exited, the file is automatically saved with the new values, i.e. there is no extra "Save" button. Depending on the size of the file, saving may take some time.

Editing an existing data list

1. To access a data editor and open an existing data list for editing, use the arrow keys to select the associated button "Edit Data List..." in the individual menu.

   The selected data list is displayed.

The cursor marks the start value of the list.
To increase readability, the bits are displayed in groups of four. The current cursor position, the length of the list and the list file name are displayed above the list. The offset starts with the value 0 which corresponds to the bit position on the left side of the first row, i.e. the beginning of the list. On the left edge of the editor, the last three offset positions are specified at the beginning of the row.

2. Use the numeric keys to enter the values 0 or 1.

3. To delete a value, use the arrow keys to mark the bit that follows the value to be deleted.

   Press the INSERT key to activate the insert mode. Values cannot be deleted in the overwrite mode.

   Press the BACKSPACE key.

   The value before the marked bit is deleted.

4. To select a bit position, select the "GoTo" button and press the ENTER key.

   Enter the bit position in the "GoTo Offset" entry field by means of the numeric keys and confirm the entry.
The cursor marks the bit at the selected position.

5. To **copy and paste** any range of bits at any position in the list:
   a) Use the the arrow keys to mark the start bit of the selection.
   b) Select the "Start Select" button and use the the arrow keys to mark the selection.
   c) Click the "Copy" button.
   d) Navigate to the insert position and select "Paste".

The selected and copied bits are pasted after the selected position.

6. To **display and edit** the values in hexadecimal form, select the "Hex" button.

   Each four bits are displayed as a hexadecimal value: To increase readability, the hexadecimal values in turn are displayed in pairs of two. The hex functions are automatically assigned to the numeric keys at the front panel.

7. To **save** the data list, press the ESC key.

   The list is saved automatically when the dialog is closed.

**Creating a new data list**

1. To create an empty data list, in the individual menu select "List Management > Select Data List to Edit... > Create Data List" and enter the file name of the new data list.

2. To open the data list for editing, select the associated button "Edit Data List..." in the individual menu.

4.6.3 **Working with Control and Marker List Editor**

The control and marker signals for digital modulation and digital standards can be very conveniently graphically defined in a "Control and Marker List Editor". The available marker signals – and, with custom digital modulation, the CW, Hop, Burst Gate and Lev Att control signals – can be defined in this editor.

While it is being processed, the file is continuously automatically buffered. Depending on the size of the file, saving may take some time.

The various functions of the editor are explained in the individual menus. This section focuses to the general use of the graphic editor.
Example:
The following figure shows the “Slot Marker Definition Editor” of the “GSM/EDGE” dialog as an example.

The upper area displays the signal for which the marker signals are to be defined. On the left side, the available signals (marker and control signals) are listed and colour-coded.

Auxiliary functions are offered in the lower editor area, e.g. presetting for the ramps in the marker signal, cursor positioning by entering the bit position and possible editing by means of value entries in a table.

The actual graphic definition of the control signals occurs in the center area of the editor. Each control signal is represented by means of a colored line along the bit axis. A cursor can be shifted alongside this line and marks the position where a ramp is to be set. The color of the cursor changes depending on the current function.

Use the ENTER key to switch over between the colors (and therefore functions):

- black: marks the bit position on the marker line
- yellow: sets a ramp
- green: activates the marked ramp for shifting.

Accessing control and marker list

1. To access the control list editor (e.g. "CList Dig Mod") and open an existing list for editing, use the arrow keys to select "Custom Digital Mod > List Management > Edit Control List".
2. To access the slot marker list editor (e.g. "Slot Marker") and open an existing list for editing, use the arrow keys to select "GSM/EDGE > Burst Editor > Slot Marker Definition".

**Editing an existing control or marker list**

1. Activate control/marker signal line for editing.
   Use the arrow keys to mark the editable graphic area and press the ENTER key.
   Select the control/marker signal line to be edit and press the ENTER key.
   The cursor is active for the selected line.

2. Define the cursor position.
   Select the parameter "Cursor Position", specify the position by means of the numeric keys and confirm the entry.
   The cursor is positioned according to the entry. If the entered value exceeds the selected length of the definition range, the length is adjusted automatically.

3. Configure the control and marker signals (see "Handling of Ramps" on page 106).

4. Define length of control list ("Custom Dig Mod" only).
   Select the "Total List Length" entry field and press the ENTER key. Enter the length by means of the numeric keys and confirm the entry.
   The control list length is defined.

5. Zoom displayed range ("Custom Dig Mod" only) in long control lists.
   To zoom the displayed area around the current "Cursor Position", select the parameter "Visible/Bits Visible", enter the number of symbols/bits to be displayed by means of the numeric keys and confirm the entry.
   Select the "Zoom In" button and press the ENTER key.
   The selected number of symbols/bits around the current cursor position are displayed.
   Ramps outside the displayed area are not lost by zooming.

6. Use the "Save"/"Save As..." function to save the edited control/marker list under its current name or under a new name.
Enter the file name in the "Create File" dialog and select the directory (see Chapter 4.8.1, "File Select Dialog", on page 110).

Handling of Ramps

1. Set a new ramp
   Use the arrow keys or use the parameter "Cursor Position" to move the cursor to the position where the ramp is to be inserted. Press the ENTER key.
   The ramp transition of the newly set ramp depends on the current status (high or low) of the control signal. If the signal is low, a ramp with low-high transition is generated; if the signal is high, a ramp with high-low transition is generated.

   ![Example of ramp settings](image)

   When ramps are set between existing ramps, the transition of the new ramp is also defined by the status of the signal before the new ramp. For this reason, a ramp that has already been set can be assigned low-low or high-high transition (as in the example), i.e. it will have no effect on the control signal in this configuration. However, the ramp remains saved, and its position is indicated by a dashed line.

   ![Example of ramp positioning](image)

   If another change produces effective transition, this ramp will be regenerated.

2. Shift a ramp
   An existing ramp can be shifted to any positions. The transitions are adjusted accordingly.
   Use the arrow keys to move the cursor to the ramp position; the cursor changes colour.
   Press the ENTER key. The cursor again changes colour. The ramp will now be shifted by means of the cursor. Press the ENTER key. The ramp will be set at the current position.
   The ramp transition depends on the status (high or low) of the control/marker signal before the ramp.

3. Delete a ramp
   Use the arrow keys to move the cursor to the ramp position; the cursor changes colour.
   Press the BACKSPACE key.
   The ramp will be deleted. The ramp transitions of the other ramps are adapted to the changed signal status (high or low).

4. Set the ramps in a table
Select the "Edit Table..." button and define the positions and states of the ramps for the selected marker.
Confirm the entries with "Accept".

5. Preset a marker signal
Select the "Preset" button to preset the marker signal.
The ramps of the selected marker are adjusted according to the selected "Preset Type".

Creating a new control list
A new control list can be created under a new name either by generating a blank file or by changing an existing list which will then be saved under a new name.

1. To create an empty control list, select "BB > Cust Dig Mod > List Management... > Select Control List to Edit > Create Control List" and enter the file name of the new control list.

2. To open the control list for editing, select the associated button "BB > Cust Dig Mod > List Management... > Select Control List to Edit > Edit Control List..." and select an existing control list.

4.7 How to Use the Help System

The R&S SMATE is equipped with a context-sensitive help function. A help page is available for each parameter and can be called any time during instrument operation.

Calling context-sensitive and general help
► To display the general help dialog box, press the HELP (F1) key.
The help dialog is displayed. A topic containing information about the current menu or the currently opened dialog box and its function is displayed.
Contents of the help dialog box

The help dialog box contains two main areas:

- "Contents" - contains a table of help contents
- "Topic" - contains a specific help topic

The help system provides additionally an "Index" and a "Find" area, as well as "Zoom" functions that are accessed by means of the corresponding buttons.

Navigating in the table of contents

1. To navigate within the table of contents entries, use the UP/DOWN keys. Entries that contain further entries are marked with a plus sign.

2. To display a help topic, press the "ENTER" key. The corresponding help topic is displayed.

Navigating in the help topics

1. To scroll through a page, use the UP/DOWN arrow keys.

2. To follow a cross-reference, select the link text.

3. To return to the previous page, select "Back". This function scrolls back all steps that you have performed before.

4. Use the "Scroll Right" or "Scroll Left" buttons to shift the indicated area of the navigation window to the left or right.

5. To maximize the "Topics" window, you can hide the contents tree with the "Hide Contents" button, and vice versa.

Using the Index

1. Select the "Go to Index" button.

2. Enter the first characters of the topic you are interested in. The entries starting with these characters are displayed.

3. Press the ENTER key to change the focus.

4. Use the UP/DOWN keys to navigate and select the suitable keyword.

5. Press the ENTER key to display the help topic. The corresponding help topic is displayed.

Closing the help window

- Press the HELP (F1) key.
4.8 File Management

The R&S SMATE uses files to save all instrument data, i.e. system and user data.

The user data includes saved instrument settings, data for the different digital standards, lists for the List mode and the user correction as well as the waveforms for the arbitrary waveform generator.

The files are stored on the hard disk of the instrument. Drive D: can be used to save user-defined data; any directory structure can be created on D:. Some default directories are predefined, but can be changed at any time. The C: drive is a protected system drive. The files on this drive contain data that must not be changed. Therefore, this drive should not be accessed, since reconstruction of the system partition will lead to data loss. To prevent inadvertent deletion or overwriting of system files, this drive is not specified in the file menus. It can be accessed if a protection level (see section "Protection Level" in the Operating Manual) is revoked.

Files can be exchanged either via a memory stick or a connected network. A memory stick is connected to the USB interface and is assigned the E: drive. In the case of a connected network, all network drives that can be accessed are available. The files are accessed in a "Save/Recall" dialog in the individual menus.

The files are differentiated according to their extensions; each type of file is assigned a specific file content. The extension is usually of no consequence to the user since access to the files occurs in the individual menus where only the relevant type of file is available. See Chapter 4.8.2.1, "Extensions for User Files", on page 113 for an overview of the supported file extensions.

The user data can be roughly divided into the following data types:

- Settings
  Settings, e.g. the frame setting of the GSM/EDGE standard, can be loaded and current setting saved to the specified file.

- Lists
  Lists, e.g. user correction lists, can be loaded. They can be generated either externally or internally. For internal generation, a new list must be created in the "File Select" dialog which will then be edited in the list editor of the individual menu.

- Complex modulation and control data
  User data of this type can be loaded. It can be generated either externally or internally. For internal generation, a new list must be created which will then be edited in the data and control list editor. These functions are offered in the "Data List Management" dialog of the individual modulation menu.

- Waveforms
  Waveforms are generated externally (e.g. by means of the R&S WinIQSIM2 program that is supplied together with the optional Baseband Generator R&S SMATE-B10) and can be loaded in the "Arbitrary Waveform Generation" dialog.

The examples within this description focus on manual operation from an external monitor with an external keyboard connected to the instrument.
For more information, refer to:

- Chapter 4.1, "Legend of Manual Controls", on page 77 for an overview of the keyboard shortcuts
- "Instrument Functions" in the Operating Manual for a detailed description of key functions.

### Accessing files with user data

1. To access an editable user data file, select the "Save/Recall" or "File Manager" function in the individual dialog.

2. To access a loadable data file, select the "Select/New" or "File Manager" function in the individual dialog.

3. To access the "File Manager" function, press the SETUP (CTRL+E) key and select "Save/Recall > File Manager".

   A "File Select" window for loading, saving or creating a file or the "File Manager" dialog for managing all files is displayed.

### Saving and loading of all instrument settings

All instrument settings are saved and loaded in the "File" menu.

To access the "File" menu, press the FILE (CTRL+S) key.

For more information, see chapter "Storing and Loading Instrument Data - File Key" in the Operating Manual.

### 4.8.1 File Select Dialog

The "Save/Recall" dialog displays the available drives and directories. In the upper part, "Recent Data Sets", the files last used are listed.
The available drives and directories and the files of the selected directory are displayed. The currently selected path is displayed above the window. Only the relevant files without file extensions are displayed. If the area is opened several times, the path last selected is displayed. When a file is saved or created, its name is user-selectable; the extension is assigned automatically and cannot be entered. The file is saved to the selected path.

In addition to the files saved by the user, some menus also offer files containing predefined contents. These files are saved to a specific directory on system drive; for this reason, this directory cannot be chosen from the "File Select" menu.

Example:
The following example shows the "File Select" menu of the GSM/EDGE digital standard when "Recall Predefined Frames" is selected.

![Image showing the "File Select" menu with predefined frames]

Working with the File Select dialog
1. Access the "File Select" dialog (see "Accessing files with user data" on page 110).
3. Load an existing file.
   In the "Recall Settings" dialog, mark a file and press the "Select" button.
4. Save a file.
   In the "Save Settings" dialog, enter file name in the "File Name:" field. Select the directory to which the file is to be saved and then select the "Save" button.
5. Create a new file.
   To create a new file, use the "Save Settings" functionality, i.e. specify file name and directory and save the file.
   The created file is empty; it must be filled with the necessary values in the individual editor.
4.8.2 File Manager

The "File Manager" allows general file management such as copying, shifting, renaming and deleting files as well as generating new directories.

Thus, also externally created files, for example waveforms created by using the R&S®WinIQSIM2 program, can be saved to the R&S SMATE by copying them from a memory stick or a network to the internal hard disk.

Use the "File Type" to select a file type from the list. This can be used to process either all files (all files (*) selection) or a specific selection of files. See Chapter 4.8.2.1, "Extensions for User Files", on page 113 for an overview of the supported file extensions. The available drives and directories and the files of the selected directory are displayed. The currently selected path is displayed above the windows. If the area is opened several times, the path last selected is displayed. Unlike the "File Select" window, the "File Manager" displays the full file names including extensions.

Working with the File Manager dialog

1. Accessing the "File Manager" dialog (see “Accessing files with user data” on page 110).

2. Navigating in the "File Manager" dialog.
   Operation is very similar to the operation of a standard Windows explorer.

3. Moving, duplicating, deleting or renaming files
   To move a file, select the file and press the "Cut" button. Mark the directory to which the file is to be moved and select the "Paste" button. If the target directory already contains a file with the same name, a confirmation query is displayed to confirm overwriting of this file.
   Perform the similar steps and cut/copy/rename/delete the file.
   **Tip:** The operation corresponds to the Windows concept.

4. Creating a new directory
Mark drive or directory level where the new directory is to be created, select the "Create New Directory" button and enter the name of the new directory in the entry window that opens. Confirm with ENTER.

### 4.8.2.1 Extensions for User Files

The following table lists all available file extensions for user files. The currently available files on the instrument depend on the installed options.

<table>
<thead>
<tr>
<th>Function/Digital Standard</th>
<th>List type</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instrument State</td>
<td>Settings</td>
<td>Instrument settings</td>
</tr>
<tr>
<td>&quot;User Correction&quot;</td>

5 Remote Control Basics

This chapter provides basic information on operating an instrument via remote control.

5.1 Remote Control Interfaces and Protocols

The instrument supports different interfaces for remote control. The following table gives an overview.

<table>
<thead>
<tr>
<th>Interface</th>
<th>Protocols, VISA(^*) address string</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>

<td>Interface (IEC/IEEE Bus Interface)(^*), on page 123.</td>
</tr>
</tbody>
</table>

\(^*\) VISA is a standardized software interface library providing input and output functions to communicate with instruments. A VISA installation on the controller is a prerequisite for remote control over LAN (when using VXI-11 or HiSLIP protocol), USB and serial interface. For remote control via socket communication VISA installation is optional. For more information, see Chapter 5.1.1, "VISA Libraries", on page 118.

Rohde & Schwarz provides the standardized I/O software library R&S VISA for communication via TCP/IP (LAN: HiSlip, VXI-11 and raw socket), USB (USBTMC) or serial interfaces.

R&S VISA is available for download at the Rohde & Schwarz website http://www.rohde-schwarz.com/rsvisa.

How to configure the remote control interfaces, see Chapter 5.2, "Starting a Remote Control Session", on page 125.

SCPI (Standard Commands for Programmable Instruments)

SCPI commands - messages - are used for remote control. Commands that are not taken from the SCPI standard follow the SCPI syntax rules. The instrument supports the SCPI version 1999. The SCPI standard is based on standard IEEE 488.2 and aims
at the standardization of device-specific commands, error handling and the status registers. The tutorial "Automatic Measurement Control - A tutorial on SCPI and IEEE 488.2" from John M. Pieper (R&S order number 0002.3536.00) offers detailed information on concepts and definitions of SCPI.

Tables provide a fast overview of the bit assignment in the status registers. The tables are supplemented by a comprehensive description of the status registers.

### 5.1.1 VISA Libraries

VISA is a standardized software interface library providing input and output functions to communicate with instruments. Thus, you can configure the interface without having to adjust the application program to the used interface. The I/O channel (LAN or TCP/IP, USB, GPIB,...) is selected at initialization time by means of the channel–specific address string ("VISA resource string"), or by an appropriately defined VISA alias (short name). See also Chapter 5.1, "Remote Control Interfaces and Protocols", on page 117 for an overview.

Instrument access via VXI-11 or HiSLIP protocols is achieved from high level programming platforms using VISA as an intermediate abstraction layer. VISA encapsulates the low-level VXI or GPIB function calls and thus makes the transport interface transparent for the user.

A VISA installation is a prerequisite for remote control using the following interfaces:

- LAN Interface using Chapter 5.1.3, "LAN Interface", on page 119
- LAN interface using Chapter 5.1.3.2, "VXI-11 Protocol", on page 121
- Chapter 5.1.4, "USB Interface", on page 122
- Chapter 5.1.5, "GPIB Interface (IEC/IEEE Bus Interface)", on page 123

Instrument access via the LAN socket protocol or GPIB connections can be operated both, with or without the VISA library.

See also Chapter 5.1.3.3, "Socket Communication", on page 121 and Chapter 5.1.5, "GPIB Interface (IEC/IEEE Bus Interface)", on page 123.

For more information about VISA refer to the user documentation.

### 5.1.2 Messages

The messages transferred on the data lines are divided into the following categories:

- **Interface messages**
  
  Interface messages are transmitted to the instrument on the data lines, with the attention line being active (LOW). They are used to communicate between the controller and the instrument. Interface messages can only be sent by instruments that have GPIB bus functionality. For details see the sections for the required interface.

- **Instrument messages**
  
  Instrument messages are employed in the same way for all interfaces, if not indicated otherwise in the description. Structure and syntax of the instrument messages are described in Chapter 5.3, "SCPI Command Structure", on page 140. A detailed
description of all messages available for the instrument is provided in the chapter "Remote Control Commands". There are different types of instrument messages, depending on the direction they are sent:
- Commands
- Instrument responses

Commands

Commands (program messages) are messages the controller sends to the instrument. They operate the instrument functions and request information. The commands are subdivided according to two criteria:

- According to the effect they have on the instrument:
  - Setting commands cause instrument settings such as a reset of the instrument or setting the frequency.
  - Queries cause data to be provided for remote control, e.g. for identification of the instrument or polling a parameter value. Queries are formed by directly appending a question mark to the command header.

- According to their definition in standards:
  - Common commands: their function and syntax are precisely defined in standard IEEE 488.2. They are employed identically on all instruments (if implemented). They refer to functions such as management of the standardized status registers, reset and self-test.
  - Instrument control commands refer to functions depending on the features of the instrument such as frequency settings. Many of these commands have also been standardized by the SCPI committee. These commands are marked as "SCPI confirmed" in the command reference chapters. Commands without this SCPI label are device-specific; however, their syntax follows SCPI rules as permitted by the standard.

Instrument responses

Instrument responses (response messages and service requests) are messages the instrument sends to the controller after a query. They can contain measurement results, instrument settings and information on the instrument status.

5.1.3 LAN Interface

To be integrated in a LAN, the instrument is equipped with a LAN interface, consisting of a connector, a network interface card and protocols. For remote control via a network, the PC and the instrument must be connected via the LAN interface to a common network with TCP/IP network protocol. They are connected using a commercial RJ45 cable. The TCP/IP network protocol and the associated network services are preconfigured on the instrument. Software for instrument control and (for specified protocols only) the VISA program library must be installed on the controller.
VISA library

Instrument access via VXI-11 protocols is usually achieved from high level programming platforms using VISA as an intermediate abstraction layer. VISA encapsulates the low level VXI or GPIB function calls and thus makes the transport interface transparent for the user. See Chapter 5.1.1, "VISA Libraries", on page 118 for details.

IP address

Only the IP address or the computer name (LAN device name) is required to set up the connection. The IP address/computer name is part of the "visa resource string" used by the programs to identify and control the instrument.

Forms of the VISA resource string:

TCPIP::host address[::LAN device name][::INSTR]

or

TCPIP::host address::port::SOCKET

where

- TCPIP designates the network protocol used
- host address is the IP address or host name of the device
- LAN device name defines the protocol and the instance number of a sub-instrument:
  - inst0 selects the VXI-11 protocol (optional, default)
  - hislip0 selects the newer HiSLIP protocol
- INSTR indicates the instrument resource class (optional)
- port determines the used port number
- SOCKET indicates the raw network socket resource class

Example:

- Instrument has the IP address 192.1.2.3; the valid resource string using VXI-11 protocol is:
  TCPIP::192.1.2.3::INSTR
- The DNS host name name is RSSM1; the valid resource string is:
  TCPIP::RSSM1::hislip0 (HiSLIP)
  TCPIP::RSSM1::INSTR (VXI-11)
- A raw socket connection can be established using:
  TCPIP::192.1.2.3::5025::SOCKET

Identifying instruments in a network

If several instruments are connected to the network, each instrument has its own IP address and associated resource string. The controller identifies these instruments by the resource string.
5.1.3.1 HiSLIP Protocol

The HiSLIP (High Speed LAN Instrument Protocol) is the successor protocol for VXI-11 for TCP-based instruments specified by the IVI foundation. The protocol uses two TCP sockets for a single connection - one for fast data transfer, the other for non-sequential control commands (e.g. Device Clear or SRQ).

HiSLIP has the following characteristics:

- High performance as with raw socket network connections
- Compatible IEEE 488.2 support for Message Exchange Protocol, Device Clear, Serial Poll, Remote/Local, Trigger, and Service Request
- Uses a single IANA registered port (4880), which simplifies the configuration of firewalls
- Supports simultaneous access of multiple users by providing versatile locking mechanisms
- Usable for IPv6 or IPv4 networks

Using VXI-11, each operation is blocked until a VXI-11 device handshake returns. However, using HiSLIP, data is sent to the device using the "fire and forget" method with immediate return. Thus, a successful return of a VISA operation such as viWrite() does not guarantee that the instrument has finished or started the requested command, but is delivered to the TCP/IP buffers.

For more information see also the application note: 1MA208: Fast Remote Instrument Control with HiSLIP.

5.1.3.2 VXI-11 Protocol

The VXI-11 standard is based on the ONC RPC (Open Network Computing Remote Procedure Call) protocol which in turn relies on TCP/IP as the network/transport layer. The TCP/IP network protocol and the associated network services are preconfigured. TCP/IP ensures connection-oriented communication, where the order of the exchanged messages is adhered to and interrupted links are identified. With this protocol, messages cannot be lost.

5.1.3.3 Socket Communication

An alternative way for remote control of the software is to establish a simple network communication using sockets. The socket communication, also referred to as "Raw Ethernet communication", does not necessarily require a VISA installation on the remote controller side. It is available by default on all operating systems.

The simplest way to establish socket communication is to use the built-in telnet program. The telnet program is part of every operating system and supports a communication with the software on a command-by-command basis. For more convenience and to enable automation by means of programs, user-defined sockets can be programmed.
Socket connections are established on a specially defined port. The socket address is a combination of the IP address or the host name of the instrument and the number of the port configured for remote-control. All R&S SMATE use port number 5025 for this purpose. The port is configured for communication on a command-to-command basis and for remote control from a program.

5.1.3.4 LAN Interface Messages

In the LAN connection, the interface messages are called low–level control messages. These messages can be used to emulate interface messages of the GPIB bus.

<table>

<tr>
<td>&amp;POL</td>
<td>Serial Poll</td>
<td>Starts a serial poll.</td>
</tr>
</tbody>
</table>

5.1.4 USB Interface

For remote control via the USB connection, the PC and the instrument must be connected via the USB type B interface. A USB connection requires the VISA library to be installed. VISA detects and configures the R&S instrument automatically when the USB connection is established. You do not have to enter an address string or install a separate driver.

USB address

The used USB address string is:

USB::<vendor ID>::<product ID>::<serial number>[:<INSTR]}

where:
Remote Control Basics

- `<vendor ID>` is the vendor ID for Rohde & Schwarz
- `<product ID>` is the product ID for the R&S instrument
- `<serial number>` is the individual serial number on the rear of the instrument

Example:
USB::0x0AAD::0x0046::100001::INSTR
0x0AAD is the vendor ID for Rohde & Schwarz
0x0046 is the product ID for the R&S SMATE
100001 is the serial number of the particular instrument

5.1.5 GPIB Interface (IEC/IEEE Bus Interface)

To be able to control the instrument via the GPIB bus, the instrument and the controller must be linked by a GPIB bus cable. A GPIB bus card, the card drivers and the program libraries for the programming language used must be provided in the controller. The controller must address the instrument with the GPIB bus address (see Chapter 5.1.5.2, "GPIB Instrument Address", on page 124).

Characteristics

The GPIB interface is described by the following characteristics:

- Up to 15 instruments can be connected
- The total cable length is restricted to a maximum of 15 m; the cable length between two instruments should not exceed 2 m.
- A wired "OR"-connection is used if several instruments are connected in parallel, since the slowest instrument determines the speed.

Any connected IEC bus cable must be terminated by an instrument or controller.

5.1.5.1 GPIB Interface Messages

Interface messages are transmitted to the instrument on the data lines, with the attention line (ATN) being active (LOW). They are used for communication between the controller and the instrument and can only be sent by a computer which has the function of a GPIB bus controller. GPIB interface messages can be further subdivided into:

- **Universal commands**: act on all instruments connected to the GPIB bus without previous addressing
- **Addressed commands**: only act on instruments previously addressed as listeners

**Universal Commands**

Universal commands are encoded in the range 10 through 1F hex. They affect all instruments connected to the bus and do not require addressing.
## Remote Control Basics

### Command Effect on the instrument

<table>
<thead>
<tr>
<th>Command</th>
<th>Effect on the instrument</th>
</tr>
</thead>
<tbody>
<tr>
<td>DCL (Device Clear)</td>
<td>Aborts the processing of the commands just received and sets the command processing software to a defined initial state. Does not change the instrument settings.</td>
</tr>
<tr>
<td>IFC (Interface Clear) *)</td>
<td>Resets the interfaces to the default setting.</td>
</tr>
<tr>
<td>LLO (Local Lockout)</td>
<td>The LOC/IEC ADDR key is disabled.</td>
</tr>
<tr>
<td>SPE (Serial Poll Enable)</td>
<td>Ready for serial poll.</td>
</tr>
<tr>
<td>SPD (Serial Poll Disable)</td>
<td>End of serial poll.</td>
</tr>
<tr>
<td>PPU (Parallel Poll Unconfigure)</td>
<td>End of the parallel-poll state.</td>
</tr>
</tbody>
</table>

*) IFC is not a real universal command, it is sent via a separate line; however, it also affects all instruments connected to the bus and does not require addressing.

### Addressed Commands

Addressed commands are encoded in the range 00 through 0F hex. They only affect instruments addressed as listeners.

<table>
<thead>
<tr>
<th>Command</th>
<th>Effect on the instrument</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET (Group Execute Trigger)</td>
<td>Triggers a previously active instrument function (e.g. a sweep). The effect of the command is the same as with that of a pulse at the external trigger signal input.</td>
</tr>
<tr>
<td>GTL (Go to Local)</td>
<td>Transition to the &quot;local&quot; state (manual control).</td>
</tr>
<tr>
<td>GTR (Go to Remote)</td>
<td>Transition to the &quot;remote&quot; state (remote control).</td>
</tr>
<tr>
<td>PPC (Parallel Poll Configure)</td>
<td>Configures the instrument for parallel poll.</td>
</tr>
<tr>
<td>SDC (Selected Device Clear)</td>
<td>Aborts the processing of the commands just received and sets the command processing software to a defined initial state. Does not change the instrument setting.</td>
</tr>
</tbody>
</table>

### 5.1.5.2 GPIB Instrument Address

In order to operate the instrument via remote control, it must be addressed using the GPIB address. The remote control address is factory preset, but it can be changed if it does not fit in the network environment. For remote control, addresses 0 through 30 are allowed. The GPIB address is maintained after a reset of the instrument settings.

#### Changing the GPIB address of the instrument

The GPIB address can be changed manually or using a remote control command.

1. Manually: press the SETUP key and select "Remote > GPIB".
Select parameter "GPIB channel address" and set the GPIB address.

2. Using remote control command:
   `SYST:COMM:GPIB:ADDR 18`

### 5.1.6 LXI Browser Interface

LAN extension for instrumentation (LXI) is an instrumentation platform for measuring instruments and test systems that is based on standard Ethernet technology, see also Chapter 2.9, "LXI Configuration", on page 48.

The LXI browser interface allows easy configuration of the LAN and remote control of the R&S SMATE without additional installation requirements. The instrument's LXI browser interface works correctly with all W3C compliant browsers.

The LAN settings are configured using the LXI Browser Interface of the R&S SMATE described in Chapter 2.9.2, "LAN Configuration", on page 52. The LXI status settings in the R&S SMATE are described in "General Instrument Settings > Remote Channel Settings > LXI Status Settings".

### 5.2 Starting a Remote Control Session

The instrument and the controller have to be connected with the suitable cable and switched on.

A remote control program must open a connection to the instrument (using VISA functionality), before it can send commands to and receive device responses from the instrument.

**In order to operate the instrument via remote control it must be addressed using the defined interface address.** See Chapter 5.1.3, "LAN Interface", on page 119, Chapter 5.1.4, "USB Interface", on page 122, Chapter 5.1.5, "GPIB Interface (IEC/IEEE Bus Interface)", on page 123 or Chapter 5.1.6, "LXI Browser Interface", on page 125 for details.

**Securing the display**

To prevent unauthorized personnel from reading the display, you can disable the frequency and level display explicitly. This is useful when you remotely control the instrument from a different location.

For information on how to disable the frequency and level display, refer to "Security > Annotation Frequency" and "Security > Annotation Amplitude" in the operating manual.

Refer to Chapter 5.2.3, "Examples", on page 127 for practical examples on setting up of a remote control link and starting of a remote control session.
5.2.1 Switching to Remote Control

After switching on, the instrument is usually in the local state and can be operated via the front panel controls (for instruments equipped with a display), a mouse and an external keyboard.

Starting remote control

1. Send a command from a controller to the instrument.
   The instrument changes to remote state as soon as it receives the command from the controller.

   **Note:** If you have sent &REN before, the automatic transition from local state to manual control by a subsequent remote command is disabled (use &GTR to enable it again).

In remote state, operation via the front panel or via mouse and keyboard is disabled. The status line indicates the "REMOTE" state.

The instrument remains in the remote state until it is reset to the local state, see Chapter 5.2.2, "Returning to Manual Operation", on page 127).

   **Tip:** Switching from manual operation to remote control and vice versa does not affect the other instrument settings.

2. Although operation via front panel, mouse and keyboard is disabled, the dialog boxes can still be opened, for example to verify settings. The buttons and setting fields are grayed out and cannot be activated.
   Additionally, you can disable the access to the dialogs with the command SYST:KLOC ON to protect the instrument against unauthorized readings.

3. To prevent unintentional return to manual operation, disable the LOCAL key of the instrument with the &LLO command (see Chapter 5.1.3.4, "LAN Interface Messages", on page 122).
   The instrument switches to "REM-LLO" state.
   The automatic transition from local state to remote state by a subsequent remote command, and the command *GTL are disabled.
To return to manual mode is only possible via remote control.

4. Unlock the LOCAL key with &GTR.

5.2.2 Returning to Manual Operation

Before returning to manual control, command processing must be completed. Otherwise, the instrument switches back to remote control immediately.

To return to manual operation, perform one of the following:

- Press the LOCAL key on the front panel.
- Select "Setup > Remote Control Channels > Local".
- While using the socket communication, terminate the remote control session.
- Send the interface command &GTL via the remote control interface.

Use the &GTR to enable the LOCAL key if it is locked.

5.2.3 Examples

This section provides examples for setting up the remote control connection, and starting a remote control session.

This section assumes basic knowledge of programming and operation of the controller. A description of the interface commands can be obtained from the corresponding manuals.

5.2.3.1 Remote Control over GPIB

The program example in this section is written in VISUAL BASIC. A condition for programming in VISUAL BASIC is that the modules NIGLOBAL (Niglobal.bas) and VIBIB32 (Vbib_32.bas) are added to the projects.
Drivers for instrument, e.g. IVI-COM and LabVIEW drivers, are available in the download area of the product website (http://www.rohde-schwarz.com/en/products/test_and_measurement/product_categories/signal_generation/).

Starting a remote control session over GPIB

As a prerequisite, the GPIB address of the instrument, which is factory-set to 28, must not have been changed.

1. Connect instrument and controller using GPIB cable and switch them on.

2. Execute following commands on the controller:
   a) Open port to the instrument
      CALL IBFIND("DEV1", generator%)
   b) Inform controller about instrument address
      CALL IBPAD(generator%, 28)
   c) Reset instrument
      CALL IBWRT(generator%, "*RST;*CLS")
   d) Set instrument to new address
      CALL IBWRT(generator%, "SYST:COMM:GPIB:ADDR 18")
   e) Inform controller about new address
      CALL IBPAD(generator%, 18)

   The GPIB address of the instrument is changed.

3. To return to manual operation send CALL IBLOC (generator%) or press the LOCAL key at the front panel.

5.2.3.2 Remote Control over LAN using VXI-11 Protocol

In this example, the I/O software library R&S VISA from Rohde & Schwarz is used to set up a LAN remote control link and remotely control the R&S SMATE. R&S VISA is running on a controller PC with Windows operating system. When the connection is set up you can send commands to the instrument, and receive the responses.

The remote control connection requires a VISA installation but no additional hardware on the controller PC. The LAN I/O channel is selected at initialization time using the VISA resource string (also referred to as "address string"). A VISA alias (short name) is used to replace the complete resource string. The host address is either the R&S SMATE’s hostname or IP address. See also Chapter 5.1.3, "LAN Interface", on page 119.

In this example, it is assumed that:

- A LAN remote control link between the controller and the R&S SMATE is already set up.
- The R&S VISA program is installed on the remote PC, see "http://www.rohde-schwarz.com/rsvisa > RS VISA Release Notes".
Configuring the controller

To remote control the R&S SMATE, we use the R&S VISA Tester application.

The instrument is preconfigured for networks using DHCP (dynamic host configuration protocol). If this configuration is used, enter the computer name in the position of the IP address.

To enable the external controller to communicate with the R&S SMATE via TCP/IP protocol, set up a remote control link as follows:

1. Make sure that the controller and the instrument are connected in the network (network cable) and switched on.
2. On the controller, start "R&S VISA > Tester 32bit" or "R&S VISA > Tester 64bit", respectively.
3. In the menu bar, select "Choose VISA Implementation > Rohde & Schwarz Visa".
4. Select "Rohde & Schwarz Visa" and confirm with "OK".
5. In the menu bar, select "Find Resource" to search for the instrument in the LAN.
6. Select "VXI-11" and "Find Resources".

R&S VISA scans the network for connected instruments and lists all detected instruments in the "Resource" list.

Note: The search may take some time, particularly in large networks.

7. Select the required instrument and confirm with "Select".

The "Find and select resource" dialog closes and R&S VISA indicates the instruments IP address in the "Resource" field of the main application window.

8. As an alternative to the IP address, you can assign an alias name to the R&S SMATE:

a) In the menu bar, select "RsVisaConfig".

b) In the toolbar, select "+" to access the "VISA Rexource String Composer".
c) Fill in the "Alias" name, the "VISA Resource String" and the "Device IP Address or host name" as shown in the figure, and confirm with "OK".

![VISA Resource String Composer](image)

The "Alias" name is assigned to the instrument.

![RVisaConfigure - 5.5.4](image)

d) Close the dialog.

The R&S SMATE is now registered in the program and can be addressed via the resource string or alias name.

9. In the main window, select "Connect".

R&S VISA establishes the connection to the R&S SMATE.

Now you can send settings to configure the instrument and receive its responses.

**Note:** If the connection cannot be set up, R&S VISA displays an error in the log view. For information on how to proceed when network failures occur, see "Status Information, Error Messages and Trouble Shooting > Resolving Network Connection Failures" in the operating manual.

For further information on the functions to read and write to an open session, as well as the utility applications the software provides, see the R&S VISA User Manual.

**Starting a remote control over LAN (using VXI-11)**

To set the instrument to remote control, you can use the addressed command &GTR, or send any command from the controller.

1. Start the R&S VISA Tester and establish the connection to the R&S SMATE, see "Configuring the controller" on page 129.
2. In the R&S VISA "Basics" tab, enter a SCPI command, e.g. "*IDN?" and confirm with "Query".

The instrument is switched to remote control when it receives a command from the controller.

3. Select "Read" to obtain the instrument response.

Tip: If the "Show Log" checkbox is checked R&S VISA displays each VISA function call in the log-view on the left. If you check the "Write Log" checkbox the log-view entry is written to the log file as well. You can operate the log-view in two modes: the "Live Mode" shows only the most recent messages whereas the "View Mode" allows you to scroll the history.

4. To set, e.g. the frequency, enter SOUR1:FREQ 4 GHz and select "Write".

To check the performed setting, SOUR1:FREQ? and select "Read".

The instrument response is 4000000000, i.e. the frequency is returned in Hz.

While remote control is active, the "Remote" icon in the status bar indicates that the instrument is in remote control mode. The operation via the front panel or via mouse and keyboard are locked, allowing a remote control program to be performed without interruption.

On the display, keys and entry fields are grayed out and cannot be activated or modified, but you can still open dialogs, for example to verify settings.

5. To disable the access to the dialogs, use the command SYST:KLOC ON.

6. To prevent unintentional return to manual operation, use the command &LLO.

   See also Chapter 5.1.3.4, "LAN Interface Messages", on page 122.

   The instrument switches to "Remote LLO" state. The LOCAL key is disabled.
7. To enable the LOCAL key, use the command &GTR.

8. To return to manual operation, see Chapter 5.2.2, "Returning to Manual Operation", on page 127.

   Tip: Switching from manual operation to remote control and vice versa does not affect the other instrument settings.

5.2.3.3 Remote Control over LAN using Socket Communication

This chapter provides an example on how to establish a remote control connection over telnet protocol and a simple sockets-based program example that can be further developed.

Setting up a Telnet Connection

To control the software, only a telnet program is required. The telnet program is part of every operating system.

1. To establish a Telnet connection with the R&S SMATE, start the telnet program.

2. Enter the access string to connect to the instrument and confirm with ENTER. The access string is composed of the open command short form) and the socket address. The socket address is a combination of the IP address or the host name of the R&S SMATE and the number of the port configured for remote-control via telnet. The R&S SMATE uses the port number 5025 for remote connection via Telnet.

   Example: o 10.113.1.150 5025

   The connection to the instrument is set up and you can send remote-control commands.

3. Even if the cursor is not visible on the screen, enter blind a remote-control command and confirm with "Enter".
After the first remote-control command has been sent, the instrument is in the "REMOTE" state, i.e. instrument control from the front panel or via mouse and keyboard is disabled and "REMOTE" is displayed in the status line.

TcpClient program examples

The following program example shows a simple TcpClient class that is intended to explain on how to get started with programming of sockets.

The example sets up a socket communication to R&S SMATE and opens a simple user interface, very similar to the telnet, which allows input of commands. To enable real automation, further development of the program is required.

TcpClient.h

```
#include <string>
using namespace std;

//defines structs for socket handling
#ifndef LINUX
    #ifdef LINUX
        #include "Winsock2.h"
```
Remote Control Basics

Starting a Remote Control Session

```cpp
#include <netinet/in.h>
#endif

typedef struct sockaddr_in SockAddrStruct;
typedef struct hostent HostInfoStruct;
class TcpClient
{
public:
    TcpClient();
    ~TcpClient();
    void connectToServer( string &hostname, int port );
    void disconnect( );
    void transmit( string &txString );
    void receive( string &rxString );
    string getCurrentHostName( ) const;
    int getCurrentPort( ) const;
private:
    string currentHostName;
    int currentPort;
    int currentSocketDescr;
    SockAddrStruct serverAddress;
    HostInfoStruct * currentHostInfo;
    bool clientIsConnected;
    int receiveBufferSize;
};

TcpClient.cpp

#ifdef LINUX
    #include <netdb.h>
    #include <unistd.h>
#endif
#include "TcpClient.h"
TcpClient::TcpClient()
: currentHostInfo( NULL ),
  currentPort( 0 ),
  currentSocketDescr( 0 ),
  clientIsConnected( false ),
  receiveBufferSize( 1024 )
{}
TcpClient::~TcpClient()
{
    currentHostInfo = NULL;
}
void TcpClient::connectToServer( string &hostname, int port )
{
    #else
    #include <netinet/in.h>
#endif

typedef struct sockaddr_in SockAddrStruct;
typedef struct hostent HostInfoStruct;
class TcpClient
{
public:
    TcpClient();
    ~TcpClient();
    void connectToServer( string &hostname, int port );
    void disconnect( );

Starting a Remote Control Session
5.3 SCPI Command Structure

SCPI commands consist of a so-called header and, in most cases, one or more parameters. The header and the parameters are separated by a “white space” (ASCII code 0 to 9, 11 to 32 decimal, e.g. blank). The headers may consist of several mnemonics (keywords). Queries are formed by appending a question mark directly to the header.

The commands can be either device-specific or device-independent (common commands). Common and device-specific commands differ in their syntax.

5.3.1 Syntax for Common Commands

Common (=device-independent) commands consist of a header preceded by an asterisk (*) and possibly one or more parameters.

Examples:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*RST</td>
<td>RESET</td>
</tr>
<tr>
<td>*ESE</td>
<td>EVENT STATUS ENABLE</td>
</tr>
<tr>
<td>*ESR?</td>
<td>EVENT STATUS QUERY</td>
</tr>
<tr>
<td>*IDN?</td>
<td>IDENTIFICATION QUERY</td>
</tr>
</tbody>
</table>

- *RST: Resets the instrument.
- *ESE: Sets the bits of the event status enable registers.
- *ESR?: Queries the contents of the event status register.
- *IDN?: Queries the instrument identification string.
5.3.2 Syntax for Device-Specific Commands

Not all commands used in the following examples are necessarily implemented in the instrument.

For demonstration purposes only, assume the existence of the following commands for this section:

- `DISPlay[:WINDow<1...4>]:MAXimize <Boolean>`
- `FORMat:READings:DATA <type>[,<length>]`
- `HCOPy:DEVice:COLor <Boolean>`
- `HCOPy:DEVice:CMAP:COLor:RGB <red>,<green>,<blue>`
- `HCOPy[:IMMediate]`
- `HCOPy:ITEM:ALL`
- `HCOPy:ITEM:LABel <string>`
- `HCOPy:PAGE:DIMensions:QUADrant[<N>]`
- `HCOPy:PAGE:ORIentation LANDscape | PORTrait`
- `HCOPy:PAGE:SCALE <numeric value>`
- `MMEMory:COPY <file_source>,<file_destination>`
- `SENSe:BANDwidth|BWIDth[:RESolution] <numeric_value>`
- `SENSe:FREQuency:STOP <numeric value>`
- `SENSe:LISTr:FREQuency <numeric_value>{,<numeric_value>}`

Long and short form

The mnemonics feature a long form and a short form. The short form is marked by upper case letters, the long form corresponds to the complete word. Either the short form or the long form can be entered; other abbreviations are not permitted.

Example:

`HCOPy:DEVice:COLor ON` is equivalent to `HCOP:DEV:COL ON`.

Case-insensitivity

Upper case and lower case notation only serves to distinguish the two forms in the manual, the instrument itself is case-insensitive.

Numeric suffixes

If a command can be applied to multiple instances of an object, e.g. specific channels or sources, the required instances can be specified by a suffix added to the command. Numeric suffixes are indicated by angular brackets (`<1...4>`, `<n>`, `<i>`) and are replaced by a single value in the command. Entries without a suffix are interpreted as having the suffix 1.
Example:
Definition: HCOPy:PAGE:DIMensions:QUADrant[<N>]
Command: HCOP:PAGE:DIM:QUAD2
This command refers to the quadrant 2.

**Different numbering in remote control**
For remote control, the suffix may differ from the number of the corresponding selection used in manual operation. SCPI prescribes that suffix counting starts with 1. Suffix 1 is the default state and used when no specific suffix is specified.

Some standards define a fixed numbering, starting with 0. If the numbering differs in manual operation and remote control, it is indicated for the corresponding command.

**Optional mnemonics**
Some command systems permit certain mnemonics to be inserted into the header or omitted. These mnemonics are marked by square brackets in the description. The instrument must recognize the long command to comply with the SCPI standard. Some commands are considerably shortened by these optional mnemonics.

Example:
Definition: HCOPy[:IMMediate]
Command: HCOP:IMM is equivalent to HCOP

**Optional mnemonics with numeric suffixes**
Do not omit an optional mnemonic if it includes a numeric suffix that is relevant for the effect of the command.

Example:
Definition: DISPlay[:WINDow<1...4>]:MAXimize <Boolean>
Command: DISP:MAX ON refers to window 1.

In order to refer to a window other than 1, you must include the optional WINDow parameter with the suffix for the required window.

DISP:WIND2:MAX ON refers to window 2.

**Parameters**
Parameters must be separated from the header by a "white space". If several parameters are specified in a command, they are separated by a comma (,). For a description of the parameter types, refer to Chapter 5.3.3, "SCPI Parameters", on page 143.

Example:
Definition: HCOPy:DEVice:CMAP:COLor:RGB <red>,<green>,<blue>
Command: HCOP:DEV:CMAP:COL:RGB 3,32,44
Special characters

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>A vertical stroke in parameter definitions indicates alternative possibilities in the sense of &quot;or&quot;. The effect of the command differs, depending on which parameter is used.</td>
</tr>
<tr>
<td>Example:</td>
</tr>
<tr>
<td>Definition: HCOPY:PAGE:ORIENTATION LANDSCAPE</td>
</tr>
<tr>
<td>Command <code>HCOPY:PAGE:ORI LAND</code> specifies landscape orientation</td>
</tr>
<tr>
<td>Command <code>HCOPY:PAGE:ORI PORT</code> specifies portrait orientation</td>
</tr>
</tbody>
</table>

Mnemonics

A selection of mnemonics with an identical effect exists for several commands. These mnemonics are indicated in the same line; they are separated by a vertical stroke. Only one of these mnemonics needs to be included in the header of the command. The effect of the command is independent of which of the mnemonics is used.

Example:

<table>
<thead>
<tr>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENSE:BANDWIDTH</td>
</tr>
<tr>
<td>The two following commands with identical meaning can be created:</td>
</tr>
<tr>
<td>SENS:BAND:RES 1</td>
</tr>
<tr>
<td>SENS:BWID:RES 1</td>
</tr>
</tbody>
</table>

[ ]

Mnemonics in square brackets are optional and may be inserted into the header or omitted.

Example: `HCOPY[:IMMEDIATE]`

`HCOPY:IMM` is equivalent to `HCOPY`

{} Parameters in curly brackets are optional and can be inserted once or several times, or omitted.

Example: `SENSe:LIST:FREquency <numeric_value>{,<numeric_value>}

The following are valid commands:
| SENS:LIST:FREQ 10 |
| SENS:LIST:FREQ 10,20 |
| SENS:LIST:FREQ 10,20,30,40 |

5.3.3 SCPI Parameters

Many commands are supplemented by a parameter or a list of parameters. The parameters must be separated from the header by a "white space" (ASCII code 0 to 9, 11 to 32 decimal, e.g. blank). Allowed parameters are:

- Numeric values
- Special numeric values
- Boolean parameters
- Text
- Character strings
- Block data

The parameters required for each command and the allowed range of values are specified in the command description.
Numeric values

Numeric values can be entered in any form, i.e. with sign, decimal point and exponent. Values exceeding the resolution of the instrument are rounded up or down. The mantissa may comprise up to 255 characters, the exponent must lie inside the value range -32000 to 32000. The exponent is introduced by an "E" or "e". Entry of the exponent alone is not allowed. In the case of physical quantities, the unit can be entered. Allowed unit prefixes are G (giga), MA (mega), MOHM and MHZ are also allowed), K (kilo), M (milli), U (micro) and N (nano). If the unit is missing, the basic unit is used.

Example: `SENS:FREQ:STOP 1.5GHz = SENS:FREQ:STOP 1.5E9`

Units

For physical quantities, the unit can be entered. Allowed unit prefixes are:

- G (giga)
- MA (mega), MOHM, MHZ
- K (kilo)
- M (milli)
- U (micro)
- N (nano)

If the unit is missing, the basic unit is used.

Example:

`SENSe:FREQ:STOP 1.5GHz = SENSe:FREQ:STOP 1.5E9`

Some settings allow relative values to be stated in percent. According to SCPI, this unit is represented by the `PCT` string.

Example:

`HCOP:PAGE:SCAL 90PCT`

Special numeric values

The texts listed below are interpreted as special numeric values. In the case of a query, the numeric value is provided.

- **MIN/MAX**
  MINimum and MAXimum denote the minimum and maximum value.

- **DEF**
  DEFault denotes a preset value which has been stored in the EPROM. This value conforms to the default setting, as it is called by the *RST command.

- **UP/DOWN**
  UP, DOWN increases or reduces the numeric value by one step. The step width can be specified via an allocated step command for each parameter which can be set via UP, DOWN.

- **INF/NINF**
INFINITY, Negative INFINITY (NINF) represent the numeric values 9.9E37 or -9.9E37, respectively. INF and NINF are only sent as instrument responses.

- **NAN**
  Not A Number (NAN) represents the value 9.91E37. NAN is only sent as an instrument response. This value is not defined. Possible causes are the division of zero by zero, the subtraction of infinite from infinite and the representation of missing values.

**Example:**
- **Setting command:** SENSE:LIST:FREQ MAXimum
- **Query:** SENS:LIST:FREQ?, Response: 3.5E9

**Queries for special numeric values**
The numeric values associated to MAXimum/MINimum/DEFault can be queried by adding the corresponding mnemonics to the command. They must be entered following the quotation mark.

**Example:** SENSE:LIST:FREQ? MAXimum
Returns the maximum numeric value as a result.

**Boolean Parameters**
Boolean parameters represent two states. The "ON" state (logically true) is represented by "ON" or a numeric value 1. The "OFF" state (logically untrue) is represented by "OFF" or the numeric value 0. The numeric values are provided as the response for a query.

**Example:**
- **Setting command:** HCOPy:DEV:COL ON
- **Query:** HCOPy:DEV:COL?
  - **Response:** 1

**Text parameters**
Text parameters observe the syntactic rules for mnemonics, i.e. they can be entered using a short or long form. Like any parameter, they have to be separated from the header by a white space. In the case of a query, the short form of the text is provided.

**Example:**
- **Setting command:** HCOPy:PAGE:ORIentation LANDscape
- **Query:** HCOP:PAGE:ORI?
  - **Response:** LAND

**Character strings**
Strings must always be entered in quotation marks (" or ").
Example:
HCOP:ITEM:LABel "Test1" or HCOP:ITEM:LABel 'Test1'

Block data
Block data is a format which is suitable for the transmission of large amounts of data. A command using a block data parameter has the following structure:

Example:
FORMat:READings:DATA #45168xxxxxxxx

The ASCII character # introduces the data block. The next number indicates how many of the following digits describe the length of the data block. In the example the 4 following digits indicate the length to be 5168 bytes. The data bytes follow. During the transmission of these data bytes all end or other control signs are ignored until all bytes are transmitted.

#0 specifies a data block of indefinite length. The use of the indefinite format requires a NL^END message to terminate the data block. This format is useful when the length of the transmission is not known or if speed or other considerations prevent segmentation of the data into blocks of definite length.

5.3.4 Overview of Syntax Elements

The following table provides an overview of the syntax elements:

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>:</td>
<td>The colon separates the mnemonics of a command. In a command line the separating semicolon marks the uppermost command level.</td>
</tr>
<tr>
<td>;</td>
<td>The semicolon separates two commands of a command line. It does not alter the path.</td>
</tr>
<tr>
<td>,</td>
<td>The comma separates several parameters of a command.</td>
</tr>
<tr>
<td>?</td>
<td>The question mark forms a query.</td>
</tr>
<tr>
<td>*</td>
<td>The asterisk marks a common command.</td>
</tr>
<tr>
<td>&quot;</td>
<td>Quotation marks introduce a string and terminate it (both single and double quotation marks are possible).</td>
</tr>
<tr>
<td>#</td>
<td>The hash symbol introduces binary, octal, hexadecimal and block data.</td>
</tr>
<tr>
<td></td>
<td>- Binary: #B10110</td>
</tr>
<tr>
<td></td>
<td>- Octal: #O7612</td>
</tr>
<tr>
<td></td>
<td>- Hexa: #HF3A7</td>
</tr>
<tr>
<td></td>
<td>- Block: #21312</td>
</tr>
</tbody>
</table>

A "white space" (ASCII-Code 0 to 9, 11 to 32 decimal, e.g. blank) separates the header from the parameters.

5.3.5 Structure of a command line

A command line may consist of one or several commands. It is terminated by one of the following:
● a <New Line>
● a <New Line> with EOI
● an EOI together with the last data byte

Several commands in a command line must be separated by a semicolon ";". If the next command belongs to a different command system, the semicolon is followed by a colon.

Example:
```
MMEM:COPY "Test1","MeasurementXY";:HCOP:ITEM ALL
```
This command line contains two commands. The first command belongs to the MMEM system, the second command belongs to the HCOP system.

If the successive commands belong to the same system, having one or several levels in common, the command line can be abbreviated. To this end, the second command after the semicolon starts with the level that lies below the common levels. The colon following the semicolon must be omitted in this case.

Example:
```
HCOP:ITEM ALL;:HCOP:IMM
```
This command line contains two commands. Both commands are part of the HCOP command system, i.e. they have one level in common.
When abbreviating the command line, the second command begins with the level below HCOP. The colon after the semicolon is omitted. The abbreviated form of the command line reads as follows:
```
HCOP:ITEM ALL;IMM
```
A new command line always begins with the complete path.

Example:
```
HCOP:ITEM ALL
HCOP:IMM
```

5.3.6 Responses to Queries

A query is defined for each setting command unless explicitly specified otherwise. It is formed by adding a question mark to the associated setting command. According to SCPI, the responses to queries are partly subject to stricter rules than in standard IEEE 488.2.

- The requested parameter is transmitted without a header.
  **Example:** `HCOP:PAGE:ORI?`, **Response:** LAND

- Maximum values, minimum values and all other quantities that are requested via a special text parameter are returned as numeric values.
  **Example:** `SENSe:FREQuency:STOP? MAX`, **Response:** 3.5E9
• Numeric values are output without a unit. Physical quantities are referred to the basic units or to the units set using the Unit command. The response 3.5E9 in the previous example stands for 3.5 GHz.

• Truth values (Boolean values) are returned as 0 (for OFF) and 1 (for ON).

  Example:
  Setting command: HCopy:DEV:COL ON
  Query: HCopy:DEV:COL?
  Response: 1

• Text (character data) is returned in a short form.

  Example:
  Setting command: HCopy:PAGE:ORIentation LANDscape
  Query: HCopy:PAGE:ORI?
  Response: LAND

5.4 Command Sequence and Synchronization

IEEE 488.2 defines a distinction between overlapped and sequential commands:

• A sequential command is one which finishes executing before the next command starts executing. Commands that are processed quickly are usually implemented as sequential commands. Sequential commands are not implemented in the instrument, however the execution time of most commands is so short that they act as sequential commands when sent in different command lines.

• An overlapping command is one which does not automatically finish executing before the next command starts executing. Usually, overlapping commands take longer to process and allow the program to do other tasks while being executed. If overlapping commands do have to be executed in a defined order, e.g. in order to avoid wrong measurement results, they must be serviced sequentially. This is called synchronization between the controller and the instrument.

Setting commands within one command line, even though they may be implemented as sequential commands, are not necessarily serviced in the order in which they have been received. In order to make sure that commands are actually carried out in a certain order, each command must be sent in a separate command line.
Example: Commands and queries in one message
The response to a query combined in a program message with commands that affect the queried value is not predictable.
The following commands always return the specified result:
:FREQ:STAR 1GHZ;SPAN 100 :FREQ:STAR?
Result:
1000000000 (1 GHz)
Whereas the result for the following commands is not specified by SCPI:
:FREQ:STAR 1GHz;STAR?;SPAN 1000000
The result could be the value of STARt before the command was sent since the instrument might defer executing the individual commands until a program message terminator is received. The result could also be 1 GHz if the instrument executes commands as they are received.

As a general rule, send commands and queries in different program messages.

Example: Overlapping command with *OPC
The instrument implements INITiate[:IMMediate] as an overlapped command. Assuming that INITiate[:IMMediate] takes longer to execute than *OPC, sending the following command sequence results in initiating a sweep and, after some time, setting the OPC bit in the ESR:
INIT; *OPC.
Sending the following commands still initiates a sweep:
INIT; *OPC; *CLS
However, since the operation is still pending when the instrument executes *CLS, forcing it into the "Operation Complete Command Idle" State (OCIS), *OPC is effectively skipped. The OPC bit is not set until the instrument executes another *OPC command.

Example: Overlapped command followed by non-conflicting commands
Suppose that the instrument is switched on to provide a real time test signal that requires some calculation time. At the same time some settings for the configuration of a different signal are made which do not interact with the generated signal (e.g. the signal may be used later on). The signal generation and the signal configuration are independent from each other, so none of the following overlapped commands needs to be synchronized:
SOUR:BB:3GPP:STAT ON
SOUR:BB:GSM:FORM FSK2
Example: Overlapped command followed by conflicting commands

Suppose that the generator is switched on to provide a real time test signal that requires some calculation time. This signal is to be added to a waveform from the second baseband generator. In this case the application program must ensure that the real signal is actually available in the added signal before further action is started. This involves an appropriate synchronization technique for the first command (the following sequence assumes an appropriate routing):

\[ \text{SOUR:BB:3GPP:STAT ON} \]

The instrument waits until command has finished.

\[ \text{SOUR2:BB:GSM:STAT ON} \]

Depending on the selected synchronization techniques, non-conflicting commands can be executed while waiting until the synchronized overlapped command has finished.

5.4.1 Preventing Overlapping Execution

To prevent an overlapping execution of commands, one of the commands *OPC, *OPC? or *WAI can be used. All three commands cause a certain action only to be carried out after the hardware has been set. By suitable programming, the controller can be forced to wait for the corresponding action to occur.

**Table 5-2: Synchronization using *OPC, *OPC? and *WAI**

<table>
<thead>
<tr>
<th>Command</th>
<th>Action</th>
<th>Programming the controller</th>
</tr>
</thead>
</table>
| *OPC    | Sets the Operation Complete bit in the ESR after all previous commands have been executed. | ● Setting bit 0 in the ESE  
          |        |   ● Setting bit 5 in the SRE  
          |        |   ● Waiting for service request (SRQ) |
| *OPC?   | Stops command processing until 1 is returned. This is only the case after the Operation Complete bit has been set in the ESR. This bit indicates that the previous setting has been completed. | Sending *OPC? directly after the command whose processing should be terminated before other commands can be executed. |
| *WAI    | Stops further command processing until all commands sent before *WAI have been executed. | Sending *WAI directly after the command whose processing should be terminated before other commands are executed. |

Command synchronization using *WAI or *OPC? appended to an overlapped command is a good choice if the overlapped command takes only little time to process. The two synchronization techniques simply block overlapped execution of the command.

For time consuming overlapped commands it is usually desirable to allow the controller or the instrument to do other useful work while waiting for command execution. Use one of the following methods:

*OPC with a service request

1. Set the OPC mask bit (bit no. 0) in the ESE: *ESE 1
2. Set bit no. 5 in the SRE: *SRE 32 to enable ESB service request.
3. Send the overlapped command with *OPC
4. Wait for a service request
   The service request indicates that the overlapped command has finished.

*OPC? with a service request
1. Set bit no. 4 in the SRE: *SRE 16 to enable MAV service request.
2. Send the overlapped command with *OPC?
3. Wait for a service request
   The service request indicates that the overlapped command has finished.

Event Status Register (ESE)
1. Set the OPC mask bit (bit no. 0) in the ESE: *ESE 1
2. Send the overlapped command without *OPC, *OPC? or *WAI
3. Poll the operation complete state periodically (by means of a timer) using the sequence: *OPC; *ESR?
   A return value (LSB) of 1 indicates that the overlapped command has finished.

*OPC? with short timeout
1. Send the overlapped command without *OPC, *OPC? or *WAI
2. Poll the operation complete state periodically (by means of a timer) using the sequence: <short timeout>; *OPC?
3. A return value (LSB) of 1 indicates that the overlapped command has finished. In case of a timeout, the operation is ongoing.
4. Reset timeout to former value
5. Clear the error queue with SYStem:ERRor? to remove the "-410, Query interrup-ted" entries.

Using several threads in the controller application
As an alternative, provided the programming environment of the controller application supports threads, separate threads can be used for the application GUI and for controlling the instrument(s) via SCPI.
A thread waiting for a *OPC? thus will not block the GUI or the communication with other instruments.

5.5 Status Reporting System
The status reporting system stores all information on the current operating state of the instrument, and on errors which have occurred. This information is stored in the status registers and in the error queue.
You can query both with the commands of the `STATus` subsystem (see chapter "Remote Control Commands" in the Operating Manual).

### 5.5.1 Hierarchy of the Status Registers

The Figure 5-1 shows the hierarchical structure of information in the status registers (ascending from left to right).

**Figure 5-1: Graphical overview of the status registers hierarchy**

OPER = Operation Status Summary Bit
RQS/MSS = Service Request Generation
ESB = Standard Event Status Summary Bit
MAV = Message Available in Output Queue
QUES  = Questionable Status Summary Bit
2      = Error-/Event-Queue
1, 0   = not used

Note: This legend explains the abbreviations to the Status Byte Register.

The R&S SMATE uses the following status registers:

- **Status Byte (STB) and Service Request Enable (SRE)**, see Chapter 5.5.3, "Status Byte (STB) and Service Request Enable Register (SRE)!", on page 155.
- **Standard Event Status**, i.e. the Event status Register (ESR) and the Event Status Enable (ESE), see Chapter 5.5.4, "Event Status Register (ESR) and Event Status Enable Register (ESE)!", on page 156.
- **Questionable Status and Operation Status**, the (SCPI status registers, see Chapter 5.5.2, "Structure of a SCPI Status Register", on page 153, Chapter 5.5.5, "Questionable Status Register (STATus:QUEStionable)", on page 157 and Chapter 5.5.6, "Operation Status Register (STATus:OPERation)", on page 157.
- **Output-Queue**
  The output queue contains the messages the instrument returns to the controller. It is not part of the status reporting system but determines the value of the MAV bit in the STB and thus is represented in the overview.
- **Error-/Event-Queue**
  The error-/event-queue contains all errors and events that have occurred in the past. When reading the queue, the instrument starts with the first occurred error/event.

All status registers have the same internal structure.

---

**SRE, ESE**

The service request enable register SRE can be used as ENABLE part of the STB if the STB is structured according to SCPI. By analogy, the ESE can be used as the ENABLE part of the ESR.

---

**5.5.2 Structure of a SCPI Status Register**

Each standard SCPI register consists of 5 parts. Each part has a width of 16 bits and has different functions. The individual bits are independent of each other, i.e. each hardware status is assigned a bit number which is valid for all five parts. Bit 15 (the most significant bit) is set to zero for all parts. Thus the contents of the register parts can be processed by the controller as positive integers.
Description of the five status register parts

The five parts of a SCPI register have different properties and functions:

- **CONDition**
  The **CONDition** part is written into directly by the hardware or the sum bit of the next lower register. Its contents reflect the current instrument status. This register part can only be read, but not written into or cleared. Its contents are not affected by reading.

- **PTRansition / NTRansition**
  The two transition register parts define which state transition of the **CONDition** part (none, 0 to 1, 1 to 0 or both) is stored in the **EVENt** part.
  The **Positive-TRansition** part acts as a transition filter. When a bit of the **CONDition** part is changed from 0 to 1, the associated **PTR** bit decides whether the **EVENt** bit is set to 1.
  - **PTR** bit =1: the **EVENt** bit is set.
  - **PTR** bit =0: the **EVENt** bit is not set.
  This part can be written into and read as required. Its contents are not affected by reading.
  The **Negative-TRansition** part also acts as a transition filter. When a bit of the **CONDition** part is changed from 1 to 0, the associated **NTR** bit decides whether the **EVENt** bit is set to 1.
  - **NTR** bit =1: the **EVENt** bit is set.
  - **NTR** bit =0: the **EVENt** bit is not set.
  This part can be written into and read as required. Its contents are not affected by reading.

- **EVENt**
  The **EVENt** part indicates whether an event has occurred since the last reading, it is the "memory" of the condition part. It only indicates events passed on by the transition filters. It is permanently updated by the instrument. This part can only be
read by the user. Reading the register clears it. This part is often equated with the entire register.

- **ENABLE**
  
The `ENABLE` part determines whether the associated `EVENT` bit contributes to the sum bit (see below). Each bit of the `EVENT` part is "ANDed" with the associated `ENABLE` bit (symbol `&`). The results of all logical operations of this part are passed on to the sum bit via an "OR" function (symbol `+`).

  - `ENABLE` bit = 0: the associated `EVENT` bit does not contribute to the sum bit
  - `ENABLE` bit = 1: if the associated `EVENT` bit is "1", the sum bit is set to "1" as well.

  This part can be written into and read by the user as required. Its contents are not affected by reading.

**Sum bit**

The sum bit is obtained from the `EVENT` and `ENABLE` part for each register. The result is then entered into a bit of the `CONDITION` part of the higher-order register.

The instrument automatically generates the sum bit for each register. Thus an event can lead to a service request throughout all levels of the hierarchy.

### 5.5.3 Status Byte (STB) and Service Request Enable Register (SRE)

The **Status Byte (STB)** is already defined in IEEE 488.2. It provides a rough overview of the instrument status by collecting the pieces of information of the lower registers. A special feature is that bit 6 acts as the sum bit of the remaining bits of the status byte.

The STB is read using the command `*STB?` or a serial poll.

The **Status Byte (STB)** is linked to the **Service Request Enable (SRE)** register. Each bit of the STB is assigned a bit in the SRE. Bit 6 of the SRE is ignored. If a bit is set in the SRE and the associated bit in the STB changes from 0 to 1, a service request (SRQ) is generated. The SRE can be set using the command `*SRE` and read using the command `*SRE?`.

**Table 5-3: Meaning of the bits used in the status byte**

<table>
<thead>
<tr>
<th>Bit No.</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0...1</td>
<td>Not used</td>
</tr>
<tr>
<td>2</td>
<td>Error Queue not empty</td>
</tr>
<tr>
<td></td>
<td>The bit is set when an entry is made in the error queue. If this bit is enabled by the SRE, each entry of the error queue generates a service request. Thus an error can be recognized and specified in greater detail by polling the error queue. The poll provides an informative error message. This procedure is to be recommended since it considerably reduces the problems involved with remote control.</td>
</tr>
<tr>
<td>3</td>
<td>QUESTIONable status register summary bit</td>
</tr>
<tr>
<td></td>
<td>The bit is set if an <code>EVENT</code> bit is set in the QUESTIONable status register and the associated <code>ENABLE</code> bit is set to 1. A set bit indicates a questionable instrument status, which can be specified in greater detail by querying the STATUS:QUESTIONable status register.</td>
</tr>
</tbody>
</table>
### 5.5.4 Event Status Register (ESR) and Event Status Enable Register (ESE)

The ESR is defined in IEEE 488.2. It can be compared with the `EVENT` part of a SCPI register. The event status register can be read out using command `*ESR?`.

The ESE corresponds to the `ENABLE` part of a SCPI register. If a bit is set in the ESE and the associated bit in the ESR changes from 0 to 1, the ESB bit in the STB is set. The ESE register can be set using the command `*ESE` and read using the command `*ESE?`.

<table>
<thead>
<tr>
<th>Bit No.</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0       | Operation Complete  
This bit is set on receipt of the command `*OPC` exactly when all previous commands have been executed. |
| 1       | Not used |
| 2       | Query Error  
This bit is set if either the controller wants to read data from the instrument without having sent a query, or if it does not fetch requested data and sends new instructions to the instrument instead. The cause is often a query which is faulty and hence cannot be executed. |
| 3       | Device-dependent Error  
This bit is set if a device-dependent error occurs. An error message with a number between -300 and -399 or a positive error number, which denotes the error in greater detail, is entered into the error queue. |
| 4       | Execution Error  
This bit is set if a received command is syntactically correct but cannot be performed for other reasons. An error message with a number between -200 and -300, which denotes the error in greater detail, is entered into the error queue. |

---

**Table 5-4: Meaning of the bits used in the event status register**

<table>
<thead>
<tr>
<th>Bit No.</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0       | Operation Complete  
This bit is set on receipt of the command `*OPC` exactly when all previous commands have been executed. |
| 1       | Not used |
| 2       | Query Error  
This bit is set if either the controller wants to read data from the instrument without having sent a query, or if it does not fetch requested data and sends new instructions to the instrument instead. The cause is often a query which is faulty and hence cannot be executed. |
| 3       | Device-dependent Error  
This bit is set if a device-dependent error occurs. An error message with a number between -300 and -399 or a positive error number, which denotes the error in greater detail, is entered into the error queue. |
| 4       | Execution Error  
This bit is set if a received command is syntactically correct but cannot be performed for other reasons. An error message with a number between -200 and -300, which denotes the error in greater detail, is entered into the error queue. |
5.5.5 Questionable Status Register (STATus:QUESTionable)

This register contains information on questionable instrument states. Such states may occur when the instrument is not operated in compliance with its specifications.

To read the register, use the query commands STAT:QUEST:COND? or STAT:QUEST[:EVEN]?

Table 5-5: Meaning of the bits used in the questionable status register

<table>
<thead>
<tr>
<th>Bit No.</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0–15</td>
<td>Not used</td>
</tr>
</tbody>
</table>

5.5.6 Operation Status Register (STATus:OPERation)

This condition part contains information on the actions currently being performed by the instrument, while the event part contains information on the actions performed by the instrument since the last readout of the register.

To read the register, use the query commands STAT:OPER:COND? or STAT:OPER[:EVEN]?

Table 5-6: Meaning of the bits used in the operation status register

</tbody>
</table>
5.5.7 Application of the Status Reporting System

The purpose of the status reporting system is to monitor the status of one or several devices in a measuring system. To do this and react appropriately, the controller must receive and evaluate the information of all devices. The following standard methods are used:

- **Service request** (SRQ) initiated by the instrument
- **Serial poll** of all devices in the bus system, initiated by the controller to find out who sent an SRQ and why
- Query of a **specific instrument status** by commands
- Query of the **error queue**

5.5.7.1 Service Request

Under certain circumstances, the instrument can send a service request (SRQ) to the controller. Usually this service request initiates an interrupt at the controller, to which the control program can react appropriately. An SRQ is always initiated if one or several of bits 2, 4 or 5 of the status byte are set and enabled in the SRE. Each of these bits combines the information of the error queue or the output buffer. To use the possibilities of the service request effectively, all bits should be set to "1" in the enable registers SRE and ESE.

**Example:**

Use command *OPC to generate an SRQ.

*ESE 1 - set bit 0 of ESE (Operation Complete)
*SRE 32 - set bit 5 of SRE (ESB).

After its settings have been completed, the instrument generates an SRQ.

The SRQ is the only possibility for the instrument to become active on its own. Each controller program should set the instrument such that a service request is initiated in the case of malfunction. The program should react appropriately to the service request.

5.5.7.2 Serial Poll

In a serial poll, just as with command *STB, the status byte of an instrument is queried. However, the query is realized via interface messages and is thus clearly faster.

The serial poll method is defined in IEEE 488.1 and used to be the only standard possibility for different instruments to poll the status byte. The method also works for instruments which do not adhere to SCPI or IEEE 488.2.

The serial poll is mainly used to obtain a fast overview of the state of several instruments connected to the controller.
5.5.7.3 Query of an instrument status

Each part of any status register can be read using queries. There are two types of commands:

- The common commands *ESR?, *IDN?, *IST?, *STB? query the higher-level registers.
- The commands of the STATus system query the SCPI registers (STATus:QUEStionable...)

The returned value is always a decimal number that represents the bit pattern of the queried register. This number is evaluated by the controller program.

Queries are usually used after an SRQ in order to obtain more detailed information on the cause of the SRQ.

5.5.7.4 Error Queue

Each error state in the instrument leads to an entry in the error queue. The entries of the error queue are detailed plain text error messages that can be looked up in the Error Log or queried via remote control using SYSTem:ERRor[:NEXT]? or SYSTem:ERRor:ALL?. Each call of SYSTem:ERRor[:NEXT]? provides one entry from the error queue. If no error messages are stored there any more, the instrument responds with 0, "No error".

The error queue should be queried after every SRQ in the controller program as the entries describe the cause of an error more precisely than the status registers. Especially in the test phase of a controller program the error queue should be queried regularly since faulty commands from the controller to the instrument are recorded there as well.

5.5.8 Reset Values of the Status Reporting System

The following table contains the different commands and events causing the status reporting system to be reset. None of the commands, except of *RST and SYSTem:PRESet affect the functional instrument settings. In particular, DCL does not change the instrument settings.

Table 5-7: Resetting the status reporting system

</tbody>
</table>
### 5.6 General Programming Recommendations

**Initial instrument status before changing settings**

Manual operation is designed for maximum possible operating convenience. In contrast, the priority of remote control is the “predictability” of the instrument status. Thus, when a command attempts to define incompatible settings, the command is ignored and the instrument status remains unchanged, i.e. other settings are not automatically adapted. Therefore, control programs should always define an initial instrument status (e.g. using the *RST command) and then implement the required settings.

**Command sequence**

As a general rule, send commands and queries in different program messages. Otherwise, the result of the query may vary depending on which operation is performed first (see also Preventing Overlapping Execution).

**Reacting to malfunctions**

The service request is the only possibility for the instrument to become active on its own. Each controller program should instruct the instrument to initiate a service request in case of malfunction. The program should react appropriately to the service request.

**Error queues**

The error queue should be queried after every service request in the controller program as the entries describe the cause of an error more precisely than the status registers. Especially in the test phase of a controller program the error queue should be queried regularly since faulty commands from the controller to the instrument are recorded there as well.

---

### Event Table

<table>
<thead>
<tr>

</tbody>
</table>

1) The first command in a command line that immediately follows a <PROGRAM MESSAGE TERMINATOR> clears the output buffer.
5.7 Common Commands

Common commands are described in the IEEE 488.2 (IEC 625-2) standard. These commands have the same effect and are employed in the same way on different devices. The headers of these commands consist of "*" followed by three letters. Many common commands are related to the Status Reporting System.

Available common commands:

*CLS
*CLS
Clear status
Sets the status byte (STB), the standard event register (ESR) and the EVENT part of the QUEStionable and the OPERation registers to zero. The command does not alter the mask and transition parts of the registers. It clears the output buffer.

Usage:
Setting only

*ESE <Value>
Event status enable
Sets the event status enable register to the specified value. The query returns the contents of the event status enable register in decimal form.

Parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;Value&gt;</td>
<td>0 to 255</td>
</tr>
</tbody>
</table>

*ESR?
Event status read
Returns the contents of the event status register in decimal form and subsequently sets the register to zero.

**Return values:**
- `<Contents>` Range: 0 to 255
- **Usage:** Query only

**IDN?**
Identification

Returns the instrument identification.

**Return values:**
- `<ID>`
  - "Rohde&Schwarz,<device type>,<serial number>,<firmware version>"
- **Example:**
  - Rohde&Schwarz,SMATE,
    1407.6004k02/000000,3.1.17.1-03.01.158
- **Usage:** Query only

**IST?**
Individual status query

Returns the contents of the IST flag in decimal form. The IST flag is the status bit which is sent during a parallel poll.

**Return values:**
- `<ISTflag>` 0 | 1
- **Usage:** Query only

**OPC**
Operation complete

Sets bit 0 in the event status register when all preceding commands have been executed. This bit can be used to initiate a service request. The query form writes a "1" into the output buffer as soon as all preceding commands have been executed. This is used for command synchronization.

**OPT?**
Option identification query

Queries the options included in the instrument. For a list of all available options and their description refer to the data sheet.
Return values:
The query returns a list of options. The options are returned at fixed positions in a comma-separated string. A zero is returned for options that are not installed.

Usage:
Query only

*PRE <Value>
Parallel poll register enable
Sets parallel poll enable register to the indicated value. The query returns the contents of the parallel poll enable register in decimal form.

Parameters:
<Value>
Range: 0 to 255

*PSC <Action>
Power on status clear
Determines whether the contents of the ENAble registers are preserved or reset when the instrument is switched on. Thus a service request can be triggered when the instrument is switched on, if the status registers ESE and SRE are suitably configured. The query reads out the contents of the "power-on-status-clear" flag.

Parameters:
<Action>
0 | 1
0
The contents of the status registers are preserved.
1
Resets the status registers.

*RCL <Number>
Recall
Loads the instrument settings from an intermediate memory identified by the specified number. The instrument settings can be stored to this memory using the command *SAV with the associated number.

It also activates the instrument settings which are stored in a file and loaded using the MMEMory:LOAD <number>, <file_name.extension> command.

*RST
Reset
Sets the instrument to a defined default status. The default settings are indicated in the description of commands.

The command is equivalent to SYSTem:PRESet.
**SAV** <Number>
Save
Stores the current instrument settings under the specified number in an intermediate memory. The settings can be recalled using the command **RCL** with the associated number.

To transfer the stored instrument settings in a file, use the command `:MMEM:STOR:STAT`.

**SRE** <Contents>
Service request enable
Sets the service request enable register to the indicated value. This command determines under which conditions a service request is triggered.

**STB?**
Status byte query
Reads the contents of the status byte in decimal form.

**TRG**
Trigger
Triggers all actions waiting for a trigger event. In particular, **TRG** generates a manual trigger signal. This common command complements the commands of the TRIGger subsystem.

**TST?**
Self-test query
Initiates self-tests of the instrument and returns an error code
Return values:

<ErrorCode> integer > 0 (in decimal format)
An error occurred.
(For details see the Service Manual supplied with the instrument).

0 No errors occurred.

Usage: Query only

*WAI
Wait to continue
Prevents servicing of the subsequent commands until all preceding commands have been executed and all signals have settled (see also command synchronization and *OPC).

Usage: Event
Annex

A Hardware Interfaces

This section covers hardware related topics, like pin assignment of the GPIB bus interface, monitor and AUX I/O connectors.

The remote control interfaces are described in details in the Operating Manual, section "Remote Control Basics".

All other interfaces are described in Chapter 2.1, "Front Panel Tour", on page 13 and Chapter 2.2, "Rear Panel Tour", on page 15.

For specifications refer to the data sheet.

A.1 GPIB Bus Interface

Pin assignment

Bus lines

- Data bus with 8 lines D0 to D7:
  The transmission is bit-parallel and byte-serial in the ASCII/ISO code. D0 is the least significant bit, D7 the most significant bit.
- Control bus with five lines:

*Figure A-1: Pin assignment of GPIB bus interface*
**Interface Functions**

Instruments which can be controlled via GPIB bus can be equipped with different interface functions. The interface function for the R&S SMATE are listed in the following table.

<table>
<thead>
<tr>
<th>Control character</th>
<th>Interface function</th>
</tr>
</thead>
<tbody>
<tr>
<td>SH1</td>
<td>Handshake source function (source handshake), full capability</td>
</tr>
<tr>

<td>USER 3</td>
<td>USER input/output which can be configured for various purposes. The following signals can be applied to the pin: • Marker 4 (output path A or path B) • CW Mode Out (output path A or path B) • No Signal (Blank) Marker (output Path A or B). This signal marks the blank time in the List mode. • HOP (output path A or B). This signal marks the trigger for frequency hopping in the List mode. • Trigger (output path A or path B) This signal marks the trigger event caused by the selected trigger signal (internally or externally) of path A or B. Additional signals for path B are available in the case of two-path instruments. The corresponding signals for Path A are applied at the pins of the AUX I/O or DIGITAL I/O interface (Clock Out). • Clock Out (output Path B; bit or symbol clock pulse) This signal corresponds to the clock signal for digital modulations. • LEV ATT (input/output path B) • BURST (input/output path B)</td>

## Digital I/O interface

<table>
<thead>
<tr>
<th>Pin</th>
<th>Signal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>40</td>
<td>RF OFF A</td>
<td>Input for fast switching of the RF output A (see section &quot;Level - EMF Menu&quot; in the Operating Manual). The input must be activated in the &quot;Level/EMF&quot; dialog or via remote control command. Active High (1) switches the RF output off. A subsequent Active Low (0) switches the RF output on again. The RF Output must be switched on when the input is activated, otherwise the control signal has no effect on the status of the RF Output. Switching is performed very fast (10μs). However, the attenuation of the switched off output is considerably less than after regular switch-off, because the connection between the RF output and attenuator is not interrupted.</td>
</tr>
<tr>
<td>41</td>
<td>MOD OFF A</td>
<td>Input for fast switching of I/Q modulator of path A (see section &quot;Level - EMF Menu&quot; in the Operating Manual). The input must be activated in the &quot;Level/EMF&quot; dialog or via remote control command. Active High (1) switches the modulations off. A subsequent Active Low (0) switches the modulations on again. The modulations must be switched on when the input is activated, otherwise the control signal has no effect on the status of the modulations. Switching is performed very fast (10μs). The control signal has no effect on the status of the digital modulations in the baseband block or of the analog modulation of the RF block. An exception is broadband amplitude modulation which uses the I/Q modulator.</td>
</tr>
<tr>
