

Important note on R&S®SFE/SFE100 firmware update

At first start up of new installed firmware version an internal level calibration process will be started automatically over the whole frequency range up to 2.7 GHz. This process is necessary to guarantee calibrated level values for the extended frequency range of R&S®SFE and R&S®SFE100 beginning with firmware version V01.40 and later.

The level calibration process on R&S®SFE/SFE100 will need several minutes (up to 5 minutes) during this first start up process.

Please wait during the start up period until the level calibration has completely been finished.

Later start up processes are not influenced by this internal level calibration and will be finished in the common start up time of R&S®SFE and R&S®SFE100.
