

R&S® RTP-K93

DDR4 Compliance Test

User Manual

1178991002
Version 09

ROHDE & SCHWARZ
Make ideas real

This document describes the DDR4 Compliance Test Procedures of the following option:

- R&S®RTP-K93 (1801.3671.02)

Other functionality of the option is described in the instrument's user manual.

1 R&S ScopeSuite overview

The R&S ScopeSuite software is used with R&S RTP oscilloscopes. It can be installed on a test computer or directly on the oscilloscope. For system requirements, refer to the Release Notes.

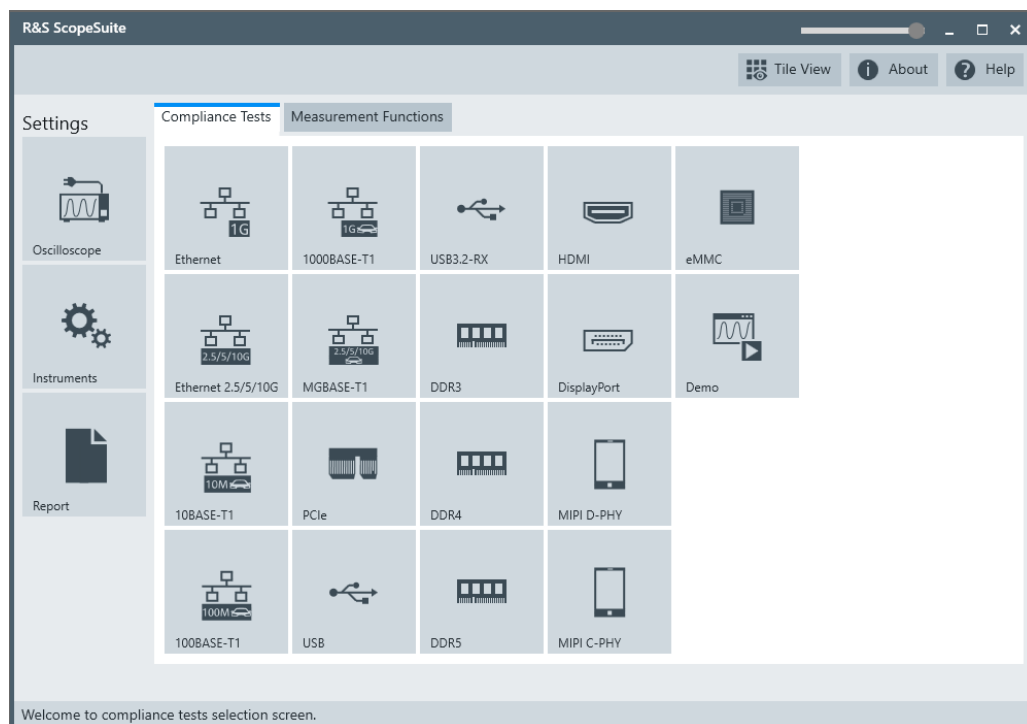

Figure 1-1: Compliance Tests

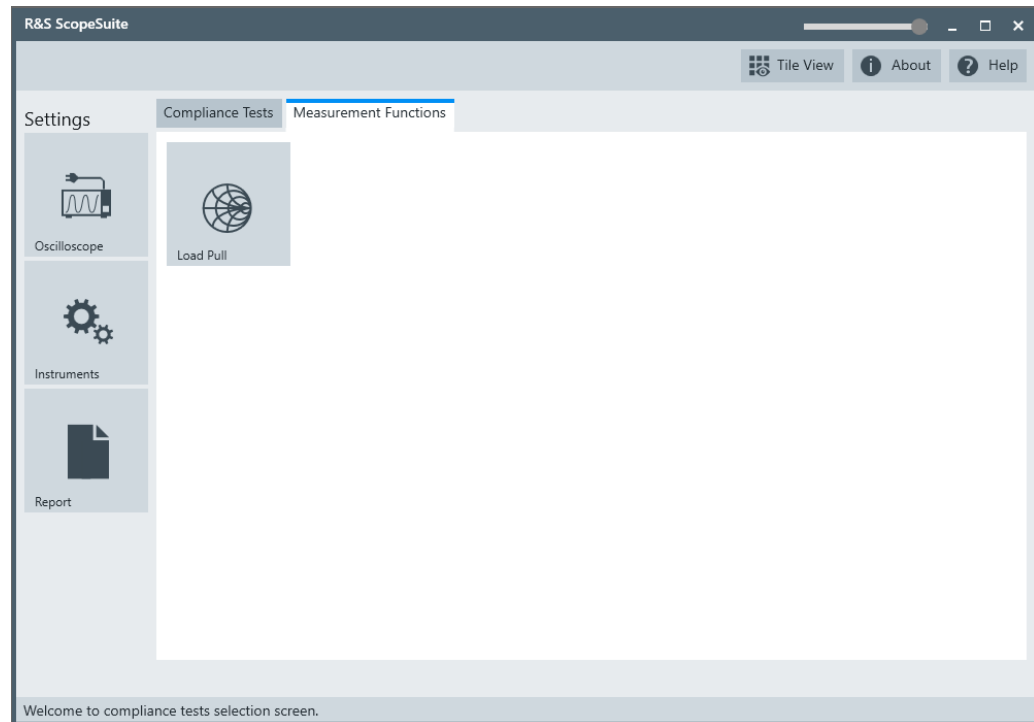

Figure 1-2: Measurement Functions

The R&S ScopeSuite main panel has several areas:

- "Settings": connection settings to oscilloscope and other instruments also default report settings
 - "Compliance Tests": selection of the compliance test
 - "Measurement Functions": selection of the measurement functions
 - "Demo": accesses demo test cases that can be used for trying out the software without having a connection to an oscilloscope
 - : shift sideways to change the transparency of the dialog box
 - "Help": opens the help file, containing information about the R&S ScopeSuite configuration
 - "About": gives information about the R&S ScopeSuite software
 - "Tile View": allows a personalization of the compliance test selection
You can configure which tests are visible in the compliance test section and which are hidden, so that only the ones you use are displayed.
- To hide a test from the "Compliance Tests" view, do one of the following:

- a) Right-click on the compliance test that you want to hide.
The icon of the test changes, see [Figure 1-3](#). Now with a left click you can hide the test.

Figure 1-3: Unpin icon

- b) Click on "Title View" to show a list of the available test cases. By clicking a test case in the show list, you can pin/unpin it from the main panel.

2 Preparing the measurements

2.1 Test equipment

For DDR4 compliance tests, the following test equipment is needed:

- R&S RTP with 4 channels and minimum 8 GHz bandwidth
- R&S RTP-K93 DDR4 compliance test option (required option, installed on the R&S RTP)
- 4 modular probes, R&S ZM90 with 9 GHz bandwidth. See also [Section 2.1.1, "Soldering guide for modular probes"](#), on page 10.
- 4 modular probe tips R&S RT-ZMA10 or R&S RT-ZMA14
- The free-of-charge R&S ScopeSuite software, which can be installed on a computer or directly on the R&S RTP.

2.1.1 Soldering guide for modular probes

All single-ended signals such as ADD, CMD, DQ, DM, CS, CKE should be soldered so that the signal is connected to the + part on the probe tip. The ground of the signal should be connected to the - part on the same probe tip.

All differential signals such as CK, DQS should be soldered differentially:

- The + signal is connected to the + part on the probe tip.
- The - signal is connected to the - part on the same probe tip.
- The ground of the signal is connected to the ground of the same probe tip.

2.2 Installing software and license

The preparation steps are performed only once for each computer and instrument that are used for testing.

Uninstall older versions of the R&S ScopeSuite

If an older version of the R&S ScopeSuite is installed, make sure to uninstall the old version before you install the new one. You can find the version number of the current installation in "Help" menu > "About". To uninstall the R&S ScopeSuite, use the Windows "Control Panel" > "Programs".

For best operation results, we recommend that the installed firmware versions of the R&S ScopeSuite and the oscilloscope are the same.

To install the R&S ScopeSuite

1. Download the latest R&S ScopeSuite software from the "Software" section on the Rohde & Schwarz R&S RTP website:
www.rohde-schwarz.com/product/rtp.html
2. Install the R&S ScopeSuite software:
 - On the computer that is used for testing, or
 - On the R&S RTP.For system requirements, refer to the Release Notes.

To install the license key on the R&S RTP

- ▶ When you got the license key of the compliance test option, enable it on the oscilloscope using [Setup] > "SW Options".
For a detailed description, refer to the R&S RTP user manual, chapter "Installing Options", or to the online help on the instrument.

2.3 Setting up the network

If the R&S ScopeSuite software runs on a test computer, the computer and the testing oscilloscope require a LAN connection.

There are two ways of connection:

- LAN (local area network): It is recommended that you connect to a LAN with DHCP server. This server uses the Dynamic Host Configuration Protocol (DHCP) to assign all address information automatically.
- Direct connection of the instruments and the computer or connection to a switch using LAN cables: Assign fixed IP addresses to the computer and the instruments and reboot all devices.

To set up and test the LAN connection

1. Connect the computer and the instruments to the same LAN.
2. Start all devices.
3. If no DHCP server is available, assign fixed IP addresses to all devices.
4. Ping the instruments to make sure that the connection is established.
5. If VISA is installed, check if VISA can access the instruments.
 - a) Start VISA on the test computer.
 - b) Validate the VISA address string of each device.

See also:

- [Section 2.5, "Connecting the R&S RTP"](#), on page 12

2.4 Starting the R&S ScopeSuite

To start the R&S ScopeSuite on the test computer or on the oscilloscope:

- ▶ Double-click the R&S ScopeSuite program icon.

To start the R&S ScopeSuite on the instrument, in the R&S RTP firmware:

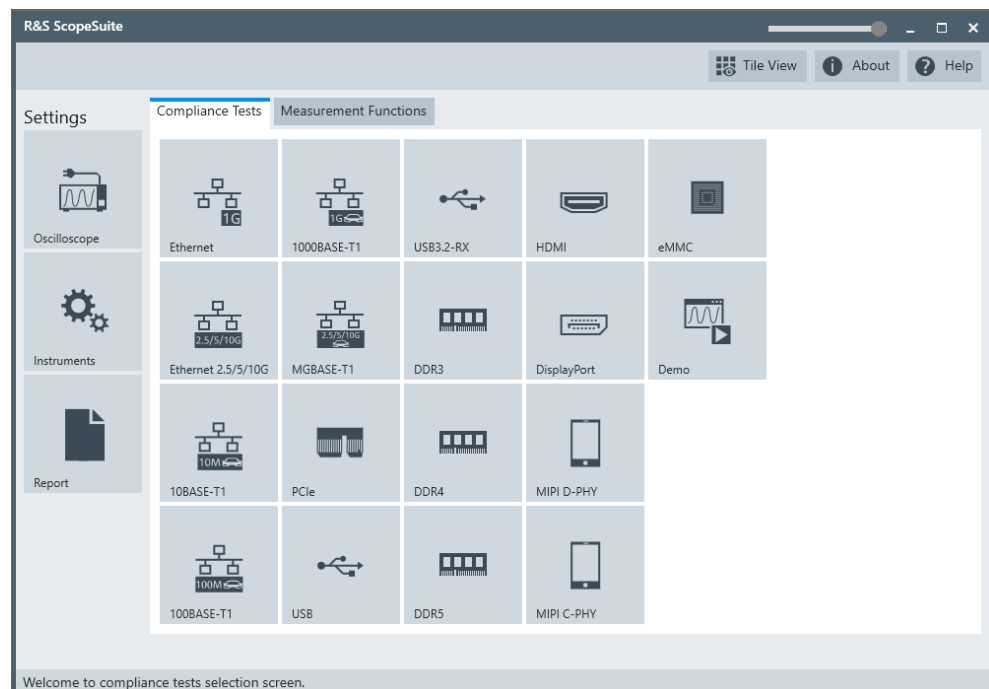

- ▶ In the "Apps" dialog, open the "Compliance" tab.

2.5 Connecting the R&S RTP

If the R&S ScopeSuite is installed directly on the instrument, the software detects the R&S RTP firmware automatically, and the "Oscilloscope" button is not available in the R&S ScopeSuite.

If the R&S ScopeSuite software runs on a test computer, the computer and the testing oscilloscope require a LAN connection, see [Section 2.3, "Setting up the network"](#), on page 11. The R&S ScopeSuite software needs the IP address of the oscilloscope to establish connection.

1. Start the R&S RTP.
2. Start the R&S ScopeSuite software.
3. Click "Settings" > "Oscilloscope".

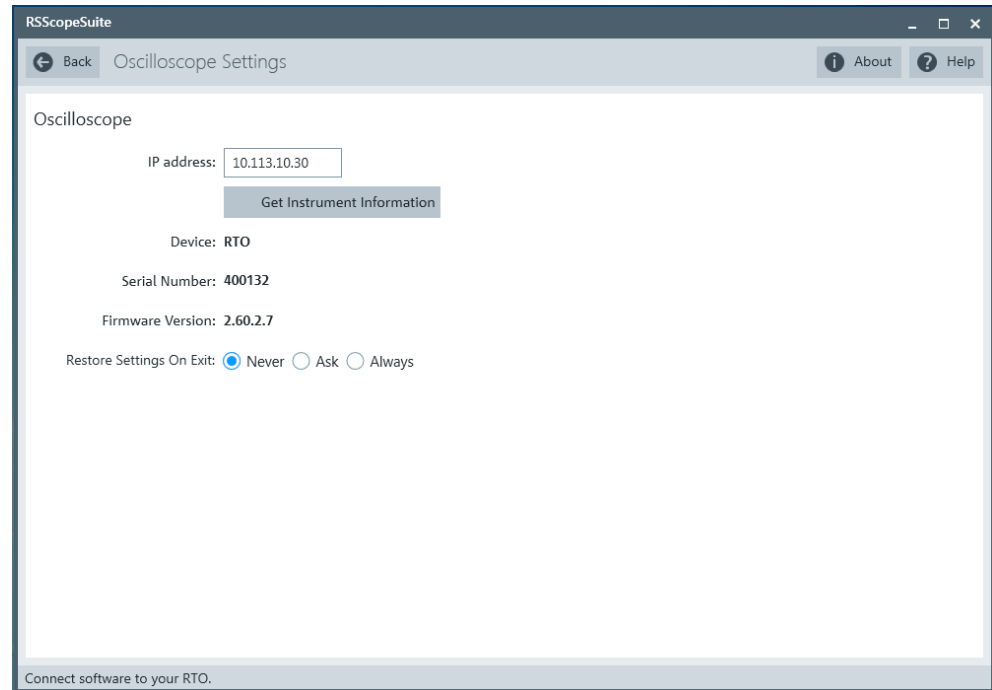

4. Enter the IP address of the oscilloscope.

To obtain the IP address: press the Rohde & Schwarz logo at the top-right corner of the oscilloscope's display.

5. Click "Get Instrument Information".

The computer connects with the instrument and gets the instrument data.

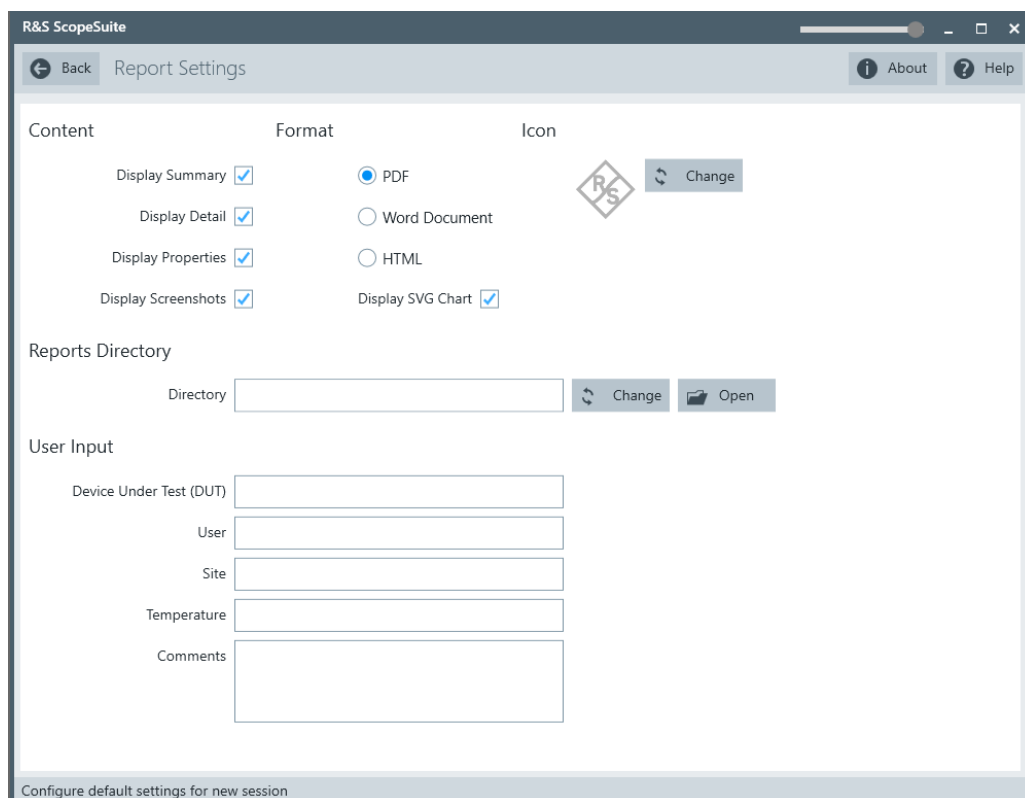

If the connection fails, an error message is shown.

2.6 Report configuration

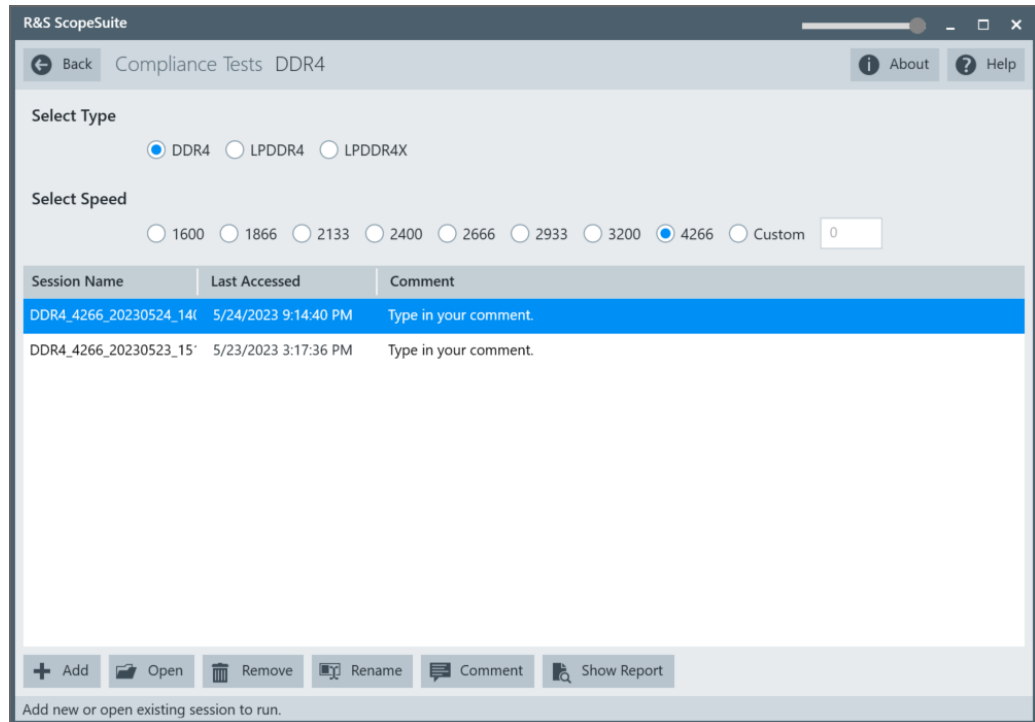

In the "Report Configuration" menu, you can select the format of the report and the details to be included in the report. You can also select an icon that is displayed in the upper left corner of the report.

Also, you can enter common information on the test that is written in the "General Information" section of the test report.

3 Performing tests

3.1 Starting a test session

After you open a compliance test, the "Session Selection" dialog appears. In this dialog, you can create new sessions, open or view existing report.

The following functions are available for handling test sessions:

Function	Description
"Add"	Adds a new session
"Open"	Opens the selected session
"Remove"	Removes the selected session
"Rename"	Changes the "Session Name"
"Comment"	Adds a comment
"Show report"	Generates a report for the selected session

To add a test session

1. In the R&S ScopeSuite window, select the compliance test.
2. In the "Session Selection" dialog press "Add".
3. If necessary change the "Session Name"

To open a test session

1. In the R&S ScopeSuite window, select the compliance test.
2. In the "Session Selection" dialog, select the session you want to open and double click on it.
Alternatively, select the session and press "Open".

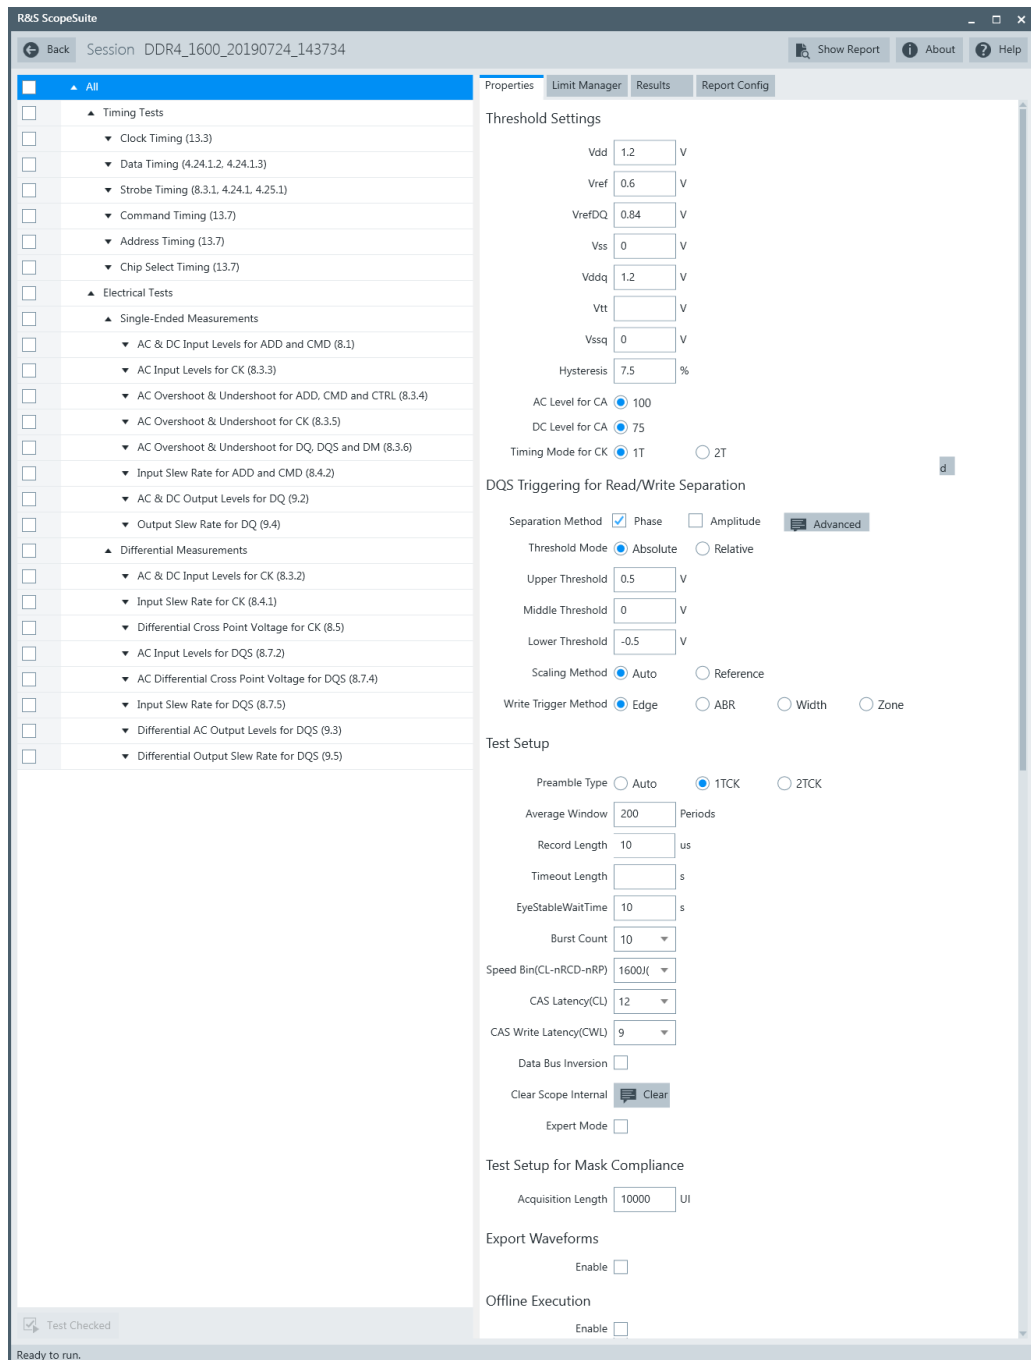

To show a report for a test session

1. In the R&S ScopeSuite window, select the compliance test.
2. In the "Session Selection" dialog, select the session you want the report for and press "Show report".

3.2 Configuring the test

1. In the R&S ScopeSuite window, select the compliance test to be performed:
 - "DDR4"
2. Select the DDR4 type and the speed.
3. Open a test session, see [Section 3.1, "Starting a test session"](#), on page 15.
4. Adjust the "Properties" settings for the test cases you want to perform.
5. Click "Limit Manager" and edit the limit criteria, see [Section 3.2.1.1, "Limit manager"](#), on page 18.
6. If you want to use special report settings the "Report Config" tab to define the format and contents of the report. Otherwise the settings defined in "RSScopeSuite" > "Settings" > "Report" are used. See [Section 2.6, "Report configuration"](#), on page 13.
7. Click "Test Checked"/"Test Single" and proceed as described in the relevant test case chapter.

3.2.1 General test settings

Each session dialog is divided into several sections:

- "Properties": shows the settings that can be made for the test case selected on the left side of the dialog. You can differentiate between the "All" and the sub test properties. In the "All" > "Properties" tab you can configure the settings for all test cases in the current session. Once you change and save a setting in this tab, the changes will

be done for all test in the sessions. At the same time, there will be a special marking for the functions that have different settings for different sub tests.

- "Limit Manager": sets the measurement limits that are used for compliance testing, see [Section 3.2.1.1, "Limit manager"](#), on page 18.
- "Results": shows an overview of the available test results for this session.
- "Instruments": defines instruments settings for connecting to external devices, that are specific for this test session.
When a session is first created the global settings ("RSScopeSuite" > "Settings" > "Instruments") are copied to the session. This "Instruments" tab can be used to change those copied defaults.
- "Report Config": defines the format and contents of the report for this session.
When a session is first created the global settings ("RSScopeSuite" > "Settings" > "Report") are copied to the session. This "Report Config" tab can be used to change those copied defaults.
- "Test Checked"/ "Test Single": starts the selected test group.

3.2.1.1 Limit manager

The "Limit Manager" shows the measurement limits that are used for compliance testing.

Each limit comprises the comparison criterion, the unit, the limit value A, and a second limit value B if the criterion requires two limits.

You can set the values to defaults, change the values in the table, export the table in xml format, or import xml files with limit settings.

You can also return the values to the original limits with "Reset to default".

- ▶ Check and adjust the measurement limits.

Measurement	Criteria	Unit	A	B
Clock Period Absolute Min	$x >= A$	s	1.18E-09	
Clock Period Absolute Max	$x <= A$	s	1.57E-09	
Clock Average Low Pulse Width	$A <= x <= B$	%	47	53
Clock Absolute Low Pulse Width	$x >= A$	%	43	
Clock Average High Pulse Width	$A <= x <= B$	%	47	53
Clock Absolute High Pulse Width	$x >= A$	%	43	
Clock Period Jitter maximum value	$A <= x <= B$	s	-7E-11	7E-11
Clock Period Jitter minimum value	$x >= A$	s	-7E-11	
Clock Cycle-to-Cycle Period Jitter	$x <= A$	s	1.4E-10	
Cumulative Error for 2 cycle minimum value	$A <= x <= B$	s	-1.03E-10	1.03E-10
Cumulative Error for 3 cycle minimum value	$A <= x <= B$	s	-1.22E-10	1.22E-10
Cumulative Error for 4 cycle minimum value	$A <= x <= B$	s	-1.36E-10	1.36E-10
Cumulative Error for 5 cycle minimum value	$A <= x <= B$	s	-1.47E-10	1.47E-10
Cumulative Error for 6 cycle minimum value	$A <= x <= B$	s	-1.55E-10	1.55E-10
Cumulative Error for 7 cycle minimum value	$A <= x <= B$	s	-1.63E-10	1.63E-10
Cumulative Error for 8 cycle minimum value	$A <= x <= B$	s	-1.69E-10	1.69E-10
Cumulative Error for 9 cycle minimum value	$A <= x <= B$	s	-1.75E-10	1.75E-10
Cumulative Error for 10 cycle minimum value	$A <= x <= B$	s	-1.8E-10	1.8E-10

3.2.2 Test configuration for DDR4

The test configuration consists of some test-specific configuration settings. The values for the settings in this tab depend on the selected "Speed" and "Type" of standard.

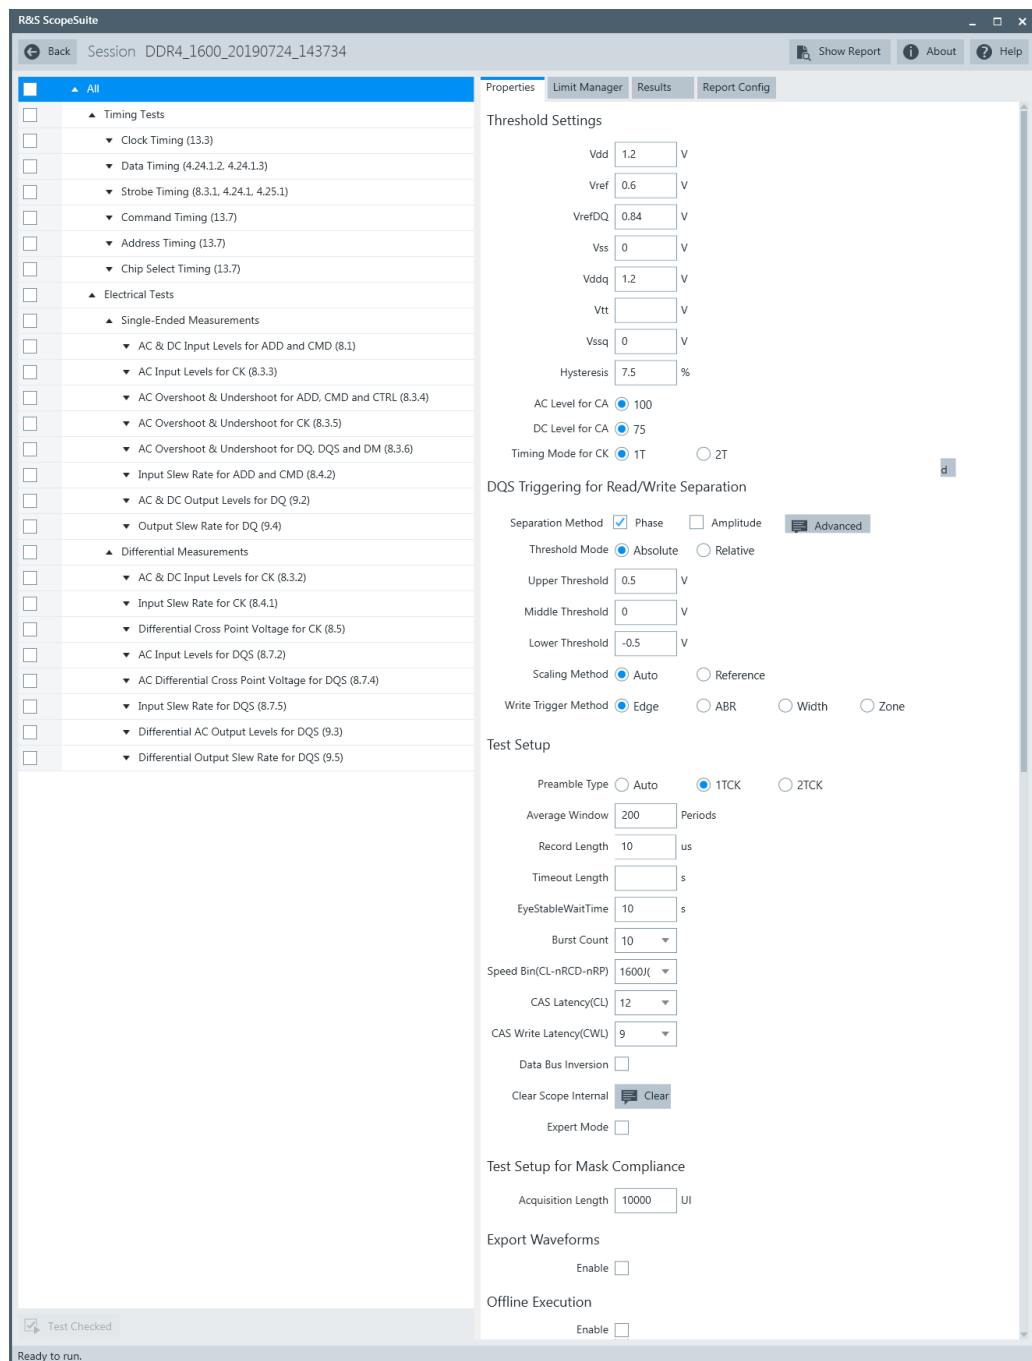

Figure 3-1: Configuration for DDR4 compliance tests

Signals

Selects the channel for the specified signal.

For electrical tests, consider also how many test signals are enabled. For example, if only the ADD/CMD signal is selected, only ADD/CMD signal is used to run the test. If both the ADD and the CMD signals are selected, test is run using ADD signal first, followed by the CMD signal.

Also, for some test cases "Invert" is available. To invert means to reflect the voltage values of all signal components against the ground level.

You can use inversion, for example, to switch the polarity of a differential signal without changing the probe connections.

The following signals are available according to the selected test case:

"ADD"	Address signal.
"CMD"	Command signal.
"CK"	Differential clock input signal.
"DQS"	Data strobe signal.
"DQ"	Data input/output signal.
"DM"	Data mask signal.
"CS"	Chip select signal.
"CKE"	Clock enable signal.

Probe mode

Selects between the "Single ended" and "Differential" mode for connecting the probe tips.

Available for the following electrical single-ended signals tests: "AC Input Levels for CK", "AC overshoot & undershoot for CK" and "AC overshoot & undershoot for DQ, DQS, and DM".

Threshold Settings

The following threshold settings are defined:

"V _{DD} "	Power supply
"V _{REF} "	Reference voltage
"V _{REFDQ} "	DQ reference voltage
"V _{SS} "	Ground
"V _{DDQ} "	DQ power supply
"V _{TT} "	$V_{TT} = V_{DDQ}/2$
"V _{SSQ} "	DQ Ground
"AC Level for CA"	AC level for the command address.
"DC Level for CA"	DC level for the command address.
"Hysteresis"	Hysteresis in %.
"Timing Mode for CK"	Equivalent to the gear-down mode, where "1T" and "2T" refers to the DUT's 1N and 2N mode, respectively. The software selects 1N mode by default.

Separation method

Selects the separation method.

"Phase"	Checks the phase difference between DQ and DQS to differentiate the type (read or write) of burst.
"Amplitude"	Checks the peak-peak amplitude difference between read and write signals on DQS to differentiate the type (read or write) of burst.
"Advanced"	Enables the definition of more detailed trigger conditions: <ul style="list-style-type: none"> • "Min Phase for Read"/"Max Phase for Read": sets the minimum/maximum phase for the read burst. • "Min Phase for Write"/"Max Phase for Write": sets the minimum/maximum phase for the write burst. • "Amplitude Relationship": sets the amplitude relationship between the read and write burst. • "P-P Amplitude Threshold": sets the peak-peak amplitude threshold.

Threshold Mode

Selects between the absolute and relative threshold mode.

Upper/Middle/Lower Threshold ← Threshold Mode

Sets the upper/middle/lower for the absolute threshold mode.

Top/Middle/Base Ratio ← Threshold Mode

Set the top/middle/base ratio for the relative threshold mode.

Write Trigger Method ← Threshold Mode

Selects the trigger method.

Preamble type

Selects the preamble type to process read or write bursts with different preamble configurations as defined in the specifications.

You can select between:

- "Auto": can be selected for preamble configurations that are not defined in specifications.
- 1TCK
- 2TCK

Scaling method

Selects the scaling method.

"Auto" The vertical scaling of the oscilloscope is adjusted so that the waveform is displayed around 80% of the screen.

"Reference" The vertical scaling is fixed with accordance to the specification.

Write Trigger Method

Selects the type of trigger used to trigger the write bursts in the waveforms.

Edge ← Write Trigger Method

For "Edge" trigger, DQS and DQ signals are triggered by their edges. For DQS, edges along 0 V are triggered. For DQ, edges along V_{ref} are triggered.

ABR ← Write Trigger Method

Selects an A-B-R trigger sequence:

- A: Trigger on DQ edge.
- B: Trigger on DQS edge.
- R: Reset if cannot find a burst with DQ and DQS edge with half UI difference.

"A -> B Delay": sets the time that the instrument waits after an A-trigger until it recognizes B-triggers.

"Reset Timeout": the instrument waits for the "Reset Timeout" time for the specified number of B-triggers. If no trigger occurs during that time, the sequence is restarted with the A-trigger.

"DQS Noise Reject" / "DQ Noise Reject": sets the number of neighboring samples that are skipped for differentiation of DQ/DQS.

Width ← Write Trigger Method

For "Width" trigger, triggers DQS signal if its pulse width is within the specified width.

"Width": the width defines the center of a range which is defined by the limits of "Delta".

"Delta": defines a range around the given width value.

"Noise Reject": sets the number of neighboring samples that are skipped for differentiation.

Zone ← Write Trigger Method

For "Zone" trigger, three exclusion zones are placed to trigger write bursts.

Average Window

Sets the average window in periods.

Record Length

Sets the number of waveform samples in one waveform record.

Timeout Length

Sets how long the oscilloscope waits for a signal transition before throwing out timeout error.

Eye stable wait time

The time that is waited for, before starting to build the eye for "Input Receiver Compliance Mask for Voltage and Timing" tests.

Burst Count

Sets the burst count.

Speed Bin (CL-nRCD-nRP)

Selects which speed bin is used for the tests.

CAS Latency (CL)

Selects the value for the CAS latency. It is the delay, measured in clock cycles, between the internal read command and the availability of the first bit of output data.

CAS Write Latency (CWL)

Selects the value for the CAS write latency. It is the delay, measured in clock cycles, between the internal write command and the availability of the first bit input data.

Clear Scope Internal

Clears the oscilloscope, if a communication error has occurred.

Expert Mode

If enabled, the "Expert Mode" allows you to bypass the guided steps of the test case.

Data Bus Inversion

Enables data bit inversion. It helps to improve the signal integrity and reduce the power consumption.

Test Setup for Mask Compliance

Defines the mask settings for the "Input Receiver Compliance Mask for Voltage and Timing (13.6)" test case.

"Acquisition Length for Eye" The time length of waveform used to draw eye.

"Mask Height" Sets the height of the waveform mask in the vertical direction.

"Mask Width" Sets the width of the waveform mask in the horizontal direction.

"Jump Step" Sets how much % the mask is moved for each iteration.

Export Waveforms

Enables you to export a waveform. You can later load the waveforms to run the tests in the offline mode, see [Offline Execution](#).

You can define an export directory, or use the default one:

```
MyDocuments\Rohde-Schwarz\RSScopeSuite\<<Version>\Waveforms\  
<ComplianceTest>\<SubTest>\<Speed>\<SessionName>
```

For example:

```
MyDocuments\Rohde-Schwarz\RSScopeSuite\4.10.0\Waveforms\DDR4\  
DDR4\2133\DDR4_2133_20190114_144116
```

Offline Execution

Offline Execution

Enable

CK waveform	<input type="text"/>	 Select
DQS waveform	<input type="text"/>	 Select
DQ waveform	<input type="text"/>	 Select
CMD waveform	<input type="text"/>	 Select
ADD waveform	<input type="text"/>	 Select
CS waveform	<input type="text"/>	 Select
CKP waveform	<input type="text"/>	 Select
CKN waveform	<input type="text"/>	 Select
DQSP waveform	<input type="text"/>	 Select
DQSN waveform	<input type="text"/>	 Select
DM waveform	<input type="text"/>	 Select
CKCM waveform	<input type="text"/>	 Select
DQSCM waveform	<input type="text"/>	 Select

If enabled, allows you to use exported waveforms as a source for the execution of the compliance test.

You can select one waveform for each needed signal.

3.3 Initiating the test

To perform compliance tests, the device under test is connected to the test board in a test-specific way. Using a probe, the test board is connected with the R&S RTP. The probe connections are test-specific. The R&S ScopeSuite guides you step-by-step through the connection setup and the test sequence.

1. Set the test setup on a nonconductive, static-approved work surface.
2. In the R&S ScopeSuite window, select the compliance test.
3. Open a test session, see [Section 3.1, "Starting a test session"](#), on page 15.
4. Check the test configuration settings and adjust, if necessary.
5. Click "Test Checked" for starting all checked test cases or "Test Single" for starting only the selected test case.

The R&S ScopeSuite test wizard explains the following individual setup steps. A detailed test description can be found in the following chapters:

- [Section 3.5, "Starting DDR4 tests"](#), on page 26

3.4 Getting test results

For each Ethernet test, the test data - report, diagrams and waveform files - is saved in the following folder:

```
%ProgramData%\Rohde-Schwarz\RSScopeSuite\5.45.1\Sessions\  
Sessions\<<DDR category>\<Session_Name>
```

If you resume an existing session, new measurements are appended to the report, new diagrams and waveform files are added to the session folder. Existing files are not deleted or replaced. Sessions data remain until you delete them in the "Results" tab of the session.

The report format can be defined in "RSScopeSuite" > "Settings" > "Report" for all compliance tests (see also [Section 2.6, "Report configuration"](#), on page 13). If you want to use special report settings for a session, you can define the format and contents of the report in the "Report Config" tab of the session.

All test results are listed in the "Results" tab. Reports can be provided in PDF, MSWord, or HTML format. To view and print PDF reports, you need a PDF viewer, for example, the Acrobat Reader.

The test report file can be created at the end of the test, or later in the "Session Selection" dialog.

To show a test report

1. In the R&S ScopeSuite window, select the compliance test to be performed.
2. Select the session name in the "Session Selection" dialog and click "Show report".

The report opens in a separate application window, depending on the file format. You can check the test results and print the report.

To delete the results, diagrams and waveform files of a session

1. In the "Session Selection" dialog select the session and open it.
2. In the "Results" tab, select the result to be deleted.
3. Click "Remove".

3.5 Starting DDR4 tests

Before you run the test, complete the following actions:

- LAN connection of the oscilloscope and the computer running the R&S ScopeSuite, see [Section 2.5, "Connecting the R&S RTP"](#), on page 12

1. Select "DDR4" in the R&S ScopeSuite start window.
2. In the "Session Selection" dialog, set the "Select Type" standard. The following "Types" are available:
 - "DDR4": Double data rate type three. Used for desktops and servers.
 - "LPDDR4": low power DDR4. Consumes very low power and is used for mobile phones.
 - "LPDDR4X": low power DDR4 extended. Consumes very low power and is used for mobile phones. Its headlined lower I/O voltage to save system power.
3. Set the "Select Speed". There are preset speeds you can select from:
"1600"/"1866"/"2133"/"2400"/"2666"/"2933"/"3200"/"4266"/
"Custom": user selected value. The values in the "Limit Manager" tab are set according to the selected speed.
4. Add a new test session.
5. Open the session. For details, see [Section 3.1, "Starting a test session"](#), on page 15.
6. Check the test configuration settings. Adjust, if necessary. See:
 - [Section 3.2.2, "Test configuration for DDR4"](#), on page 19
 - [Section 3.2.1.1, "Limit manager"](#), on page 18
7. Select/check the test cases you want to run and click "Test Single"/"Test checked".
8. A step-by step guide explains the following individual setup steps. When you have finished all steps of the step-by-step guide, the compliance test runs automatically.

4 Timing tests

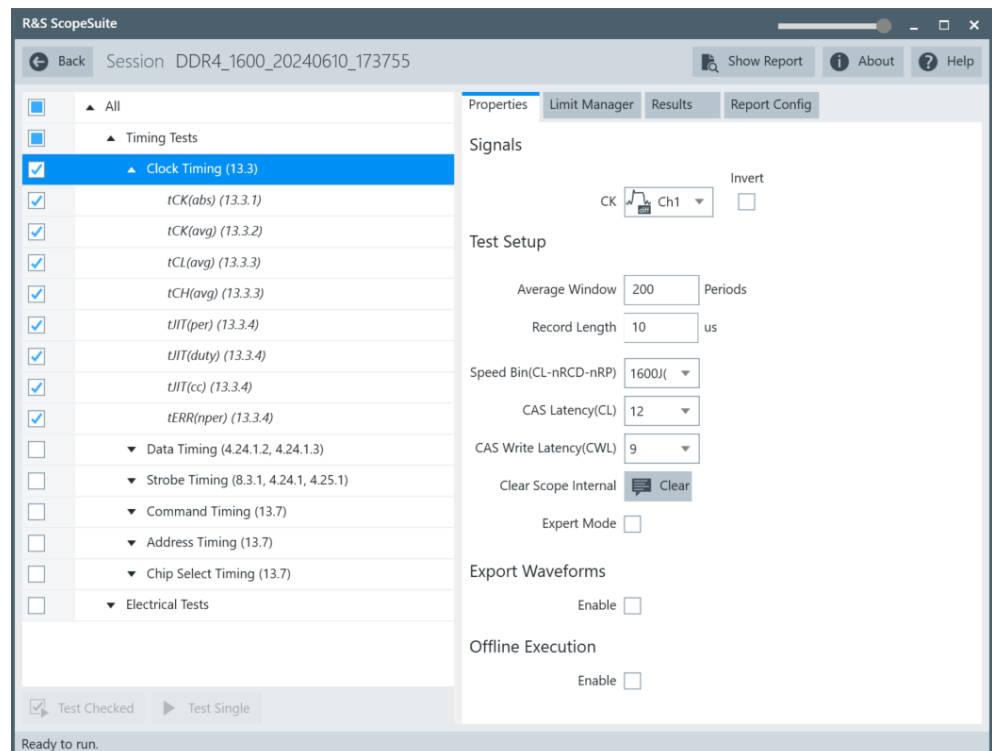

4.1 Clock timing

4.1.1 Test equipment

Item	Description, model	Quantity
Rohde & Schwarz oscilloscope	R&S RTP with 4 channels and minimum 8 GHz bandwidth	1
Modular probe	probe with minimum 9 GHz bandwidth	1
Probe tip	R&S RT-ZMA10 or R&S RT-ZMA14	1
DUT	DDR4 device that supports the selected type	1

4.1.2 Performing the tests

1. Start the test as described in [Section 3.5, "Starting DDR4 tests"](#), on page 26.
2. Select "Timing Tests" > "Clock Timing".

3. Enable the tests that you want to run.
4. Click "Test Single".
5. Follow the instructions of the step-by step guide.
When you have finished all steps, the compliance test runs automatically.
6. You can also run the test in offline mode, using downloaded waveforms. For details, see ["Offline Execution"](#) on page 25.

4.1.3 Test setup

The software guides you to make the proper connections. Follow the steps to conduct the test.

The software is intended to facilitate the execution of a set of measurements on the relevant signals.

Consider also the soldering guide, see [Section 2.1, "Test equipment"](#), on page 10.

4.1.4 Measurements

The clock timing measurements consist of up to eight measurements. They test the limits as defined in the JESD79-4B(DDR4)/ JESD209-4B(LPDDR4) specifications.

4.1.4.1 Average clock period - $t_{CK(avg)}$

This test aims to verify that the average clock period $t_{CK(avg)}$ is within the limits defined in section 13.3.2 (DDR4)/ 10.1.1 (LPDDR4/LPDDR4X) of the specification. $t_{CK(avg)}$ is the average clock period calculated across any consecutive 200 cycle window. The clock period is defined from rising edge to rising edge.

4.1.4.2 Absolute clock period - $t_{CK(abs)}$

This test aims to verify that the average absolute clock period $t_{CK(abs)}$ is within the limits defined in section 13.3.1 (DDR4)/ 10.1.2 (LPDDR4/LPDDR4X) of the specification. $t_{CK(abs)}$ is the absolute clock period from one rising edge to the next rising edge.

4.1.4.3 Average low pulse width - $t_{CL(avg)}$

This test aims to verify that the average low pulse width $t_{CL(avg)}$ is within the limits defined in section 13.3.3 (DDR4)/ 10.1.3 (LPDDR4/LPDDR4X) of the specification. $t_{CL(avg)}$ is the average low pulse width, as calculated across any consecutive 200 low pulses.

4.1.4.4 Average high pulse Width - $t_{CH(avg)}$

This test aims to verify that the average high pulse width $t_{CH(avg)}$ is within the limits defined in section 13.3.3 (DDR4)/ 10.1.3 (LPDDR4/LPDDR4X) of the specification. $t_{CH(avg)}$ is the average low pulse width, as calculated across any consecutive 200 low pulses.

4.1.4.5 Clock period jitter - $t_{JIT(per)}$

This test aims to verify that the clock period jitter $t_{JIT(per)}$ is within the limits defined in section 13.3.4 (DDR4)/ 10.1.5 (LPDDR4/LPDDR4X) of the specification. It is the largest deviation of any signal t_{CK} from $t_{CK(avg)}$. It defines the single period jitter when the DLL is already locked.

4.1.4.6 Half period jitter - $t_{JIT(duty)}$

This test aims to verify that the half period jitter $t_{JIT(duty)}$ is within the limits defined in section 13.3.4 (DDR4)/ 10.1.6 (LPDDR4/LPDDR4X) of the specification. $t_{JIT(duty)}$ is the largest deviation of any signal t_{CK} from $t_{CK(avg)}$.

4.1.4.7 Cycle to cycle period jitter - $t_{JIT(cc)}$

This test aims to verify that the cycle to cycle period jitter $t_{JIT(cc)}$ is within the limits defined in section 13.3.4 (DDR4)/ 10.1.6 (LPDDR4/LPDDR4X) of the specification. $t_{JIT(cc)}$ is the absolute difference in clock period between two consecutive clock cycles. It defines the cycle to cycle jitter when the DLL is already locked.

4.1.4.8 Cumulative error - $t_{ERR(nper)}$

This test aims to verify that the cumulative error $t_{ERR(nper)}$ is within the limits defined in section 13.3.4 (DDR4)/ 10.1 (LPDDR4/LPDDR4X) of the specification. $t_{ERR(nper)}$ is the cumulative error across n multiple consecutive cycles from $t_{CK(avg)}$.

4.2 Data timing

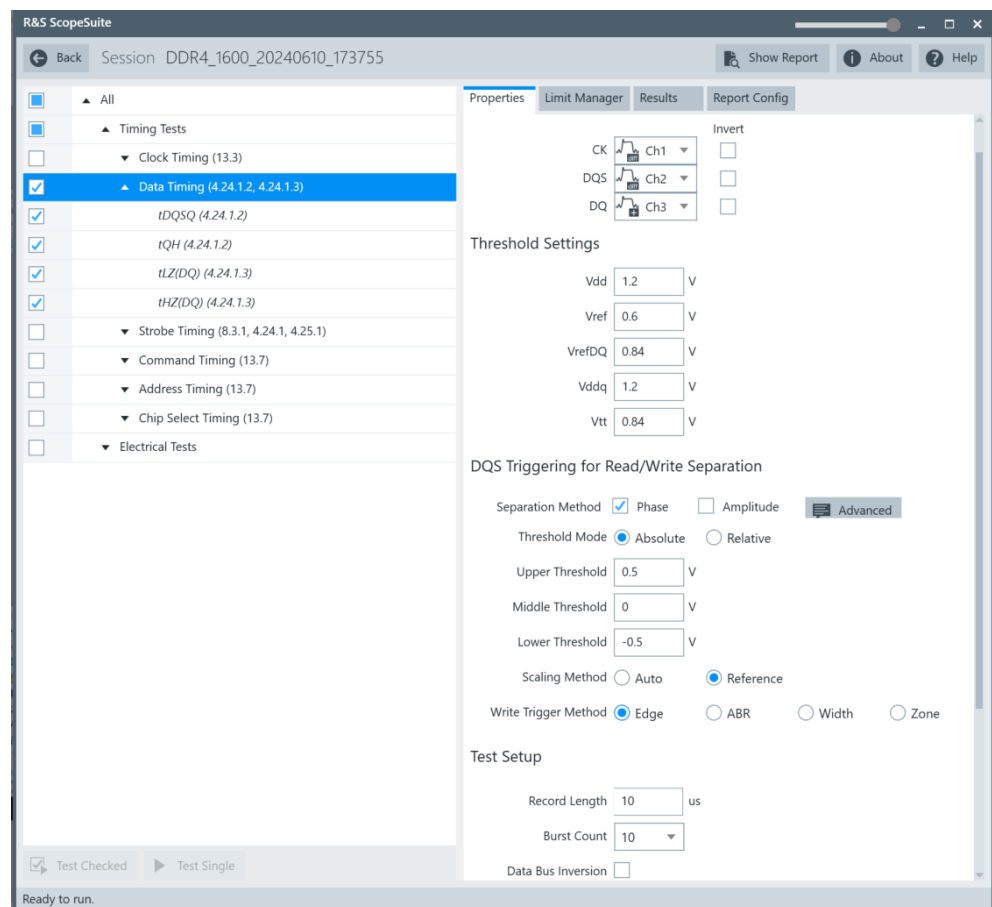

4.2.1 Test equipment

Item	Description, model	Quantity
Rohde & Schwarz oscilloscope	R&S RTP with 4 channels and minimum 8 GHz bandwidth	1
Modular probe	probe with minimum 9 GHz bandwidth	3

Item	Description, model	Quantity
Probe tip	R&S RT-ZMA10 or R&S RT-ZMA14	3
DUT	DDR4 device that supports the selected type	1

4.2.2 Performing the tests

1. Start the test as described in [Section 3.5, "Starting DDR4 tests"](#), on page 26.
2. Select "Timing Tests" > "Data Timing".

3. Enable the tests that you want to run.
4. Click "Test Single".
5. Follow the instructions of the step-by step guide.
When you have finished all steps, the compliance test runs automatically.
6. You can also run the test in offline mode, using downloaded waveforms. For details, see ["Offline Execution"](#) on page 25.

4.2.3 Test setup

The software guides you to make the proper connections. Follow the steps to conduct the test.

The software is intended to facilitate the execution of a set of measurements on the relevant signals.

Consider also the soldering guide, see [Section 2.1, "Test equipment"](#), on page 10.

4.2.4 Measurements

The data timing measurements consist of up to 10 measurements. They test the limits as defined in the JESD79-4B(DDR4)/ JESD209-4B(LPDDR4) specifications.

4.2.4.1 DQS-DQ Skew for DQS and associated DQ Signals - t_{DQSQ}

This test aims to verify that the strobe to data skew, per group, per access is within the limits defined in section 4.24.1.2 (DDR4)/ 10.5 (LPDDR4/LPDDR4X) of the specification.

4.2.4.2 DQ/DQS output hold time from DQS - t_{QH}

This test aims to verify that the data output hold time from strobe is within the limits defined in section 4.24.1.2 (DDR4)/ 10.5 (LPDDR4/LPDDR4X) of the specification.

4.2.4.3 DQ Out high impedance time from CK_t/CK_c - $t_{HZ(DQ)}$

This test aims to verify that the data high impedance time from CK_t/CK_c is within the limits defined in section 4.24.1.3 (DDR4) of the specification.

4.2.4.4 DQ Low-Impedance time from CK_t/CK_c - $t_{LZ(DQ)}$

This test aims to verify that the data low impedance time from CK_t/CK_c is within the limits defined in section 4.24.1.3 (DDR4) of the specification.

4.3 Strobe timing

4.3.1 Test equipment

Item	Description, model	Quantity
Rohde & Schwarz oscilloscope	R&S RTP with 4 channels and minimum 8 GHz bandwidth	1
Modular probe	probe with minimum 9 GHz bandwidth	3
Probe tip	R&S RT-ZMA10 or R&S RT-ZMA14	3
DUT	DDR4 device that supports the selected type	1

4.3.2 Performing the tests

1. Start the test as described in [Section 3.5, "Starting DDR4 tests"](#), on page 26.
2. Select "Timing Tests" > "Strobe Timing".

The screenshot displays the R&S ScopeSuite interface for configuring Strobe Timing tests. The left-hand pane shows a hierarchical tree of tests, with the 'Strobe Timing' category expanded and several individual tests checked. The right-hand pane is divided into several sections for configuration:

- Signals:** CK (Ch1), DQS (Ch2), and DQ (Ch3) are listed with 'Invert' checkboxes.
- Threshold Settings:** Vdd (1.2 V), Vref (0.6 V), VrefDQ (0.84 V), Vddq (1.2 V), and Vtt (0.84 V) are set.
- DQS Triggering for Read/Write Separation:** Separation Method is set to 'Phase', Threshold Mode to 'Absolute', and Write Trigger Method to 'Edge'.
- Test Setup:** Preamble Type is set to '1TCK', Record Length is 10 us, Timeout Length is 35 s, and Burst Count is 10.
- Export Waveforms:** The 'Enable' checkbox is unchecked.
- Offline Execution:** The 'Enable' checkbox is unchecked.

At the bottom of the interface, there are buttons for 'Test Checked' and 'Test Single'.

3. Enable the tests that you want to run.
4. Click "Test Single".
5. Follow the instructions of the step-by step guide.
When you have finished all steps, the compliance test runs automatically.

6. You can also run the test in offline mode, using downloaded waveforms. For details, see ["Offline Execution"](#) on page 25.

4.3.3 Test setup

The software guides you to make the proper connections. Follow the steps to conduct the test.

The software is intended to facilitate the execution of a set of measurements on the relevant signals.

Consider also the soldering guide, see [Section 2.1, "Test equipment"](#), on page 10.

4.3.4 Measurements

The strobe measurements consist of up to 10 measurements. They test the limits as defined in the JESD79-4B(DDR4)/ JESD209-4B(LPDDR4) specifications.

4.3.4.1 Time before ringback - $t_{DVAC(Strobe)}$

This test aims to verify that the time before ringback for strobe is within the limits defined in section 8.3.1 of the DDR4 specification. $t_{DVAC(Strobe)}$ is the "time above AC-level" during a differential AC-swing.

4.3.4.2 Time before ringback - $t_{DVAC(Clock)}$

This test aims to verify that the time before ringback for CK /CK# is within the limits defined in section 8.3.1 of the DDR4 specification. $t_{DVAC(Clock)}$ is the "time above AC-level" during a differential AC-swing.

4.3.4.3 Low-Impedance time from CK/CK# - $t_{LZ(DQS)}$

This test aims to verify that the strobe low-impedance time is within the limits defined in section 4.24.1 (DDR4) of the specification.

4.3.4.4 High-Impedance time from CK/CK# - $t_{HZ(DQS)}$

This test aims to verify that the strobe high-impedance time is within the limits defined in section 4.24.1 (DDR4) of the specification.

4.3.4.5 DQS output access time from CK/CK # - t_{DQsck}

This test aims to verify that the strobe rising edge output access time from rising CK/CK# is within the limits defined in section 4.24.1 (DDR4) of the specification.

4.3.4.6 Differential read preamble - t_{RPRE}

This test aims to verify that the strobe differential READ preamble is within the limits defined in section 4.24.1 (DDR4) of the specification.

4.3.4.7 Read postamble - t_{RPST}

This test aims to verify that the strobe differential READ postamble is within the limits defined in section 4.24.1 (DDR4) of the specification.

4.3.4.8 Differential output high time - t_{QSH}

This test aims to verify that the strobe differential output high time is within the limits defined in section 4.24.1 (DDR4)/ 10.5 (LPDDR4/LPDDR4X) of the specification.

4.3.4.9 Differential output low time - t_{QSL}

This test aims to verify that the strobe differential output low time is within the limits defined in section 4.24.1(DDR4)/ 10.5 (LPDDR4/LPDDR4X) of the specification.

4.3.4.10 DQS latching transition to associated clock edge - t_{DQSS}

This test aims to verify that the time interval from the strobe rising edge to CK/CK# rising edge is within the limits defined in section 4.25.1 (DDR4)/ 4.11.2 (LPDDR4/LPDDR4X) of the specification.

4.3.4.11 DQS input high pulse width - t_{DQSH}

This test aims to verify that the strobe differential input high pulse width is within the limits defined in section 4.25.1 (DDR4)/ 4.11.2 (LPDDR4/LPDDR4X) of the specification.

4.3.4.12 DQS input low pulse width - t_{DQSL}

This test aims to verify that the strobe differential input low pulse width is within the limits defined in section 4.25.1 (DDR4)/ 4.11.2 (LPDDR4/LPDDR4X) of the specification.

4.3.4.13 DQS falling edge to CK setup time - t_{DSS}

This test aims to verify that the time interval from the strobe falling edge setup time to the CK/CK# rising edge is within the limits defined in section 4.25.1 (DDR4)/ 4.11.2 (LPDDR4/LPDDR4X) of the specification.

4.3.4.14 DQS falling edge hold time from CK - t_{DSH}

This test aims to verify that the strobe falling edge hold time from CK/CK# rising edge is within the limits defined in section 4.25.1 (DDR4)/ 4.11.2 (LPDDR4/LPDDR4X) of the specification.

4.3.4.15 Write preamble - t_{WPRE}

This test aims to verify that the strobe differential WRITE preamble is within the limits defined in section 4.25.1 (DDR4) of the specification.

4.3.4.16 Write postamble - t_{WPST}

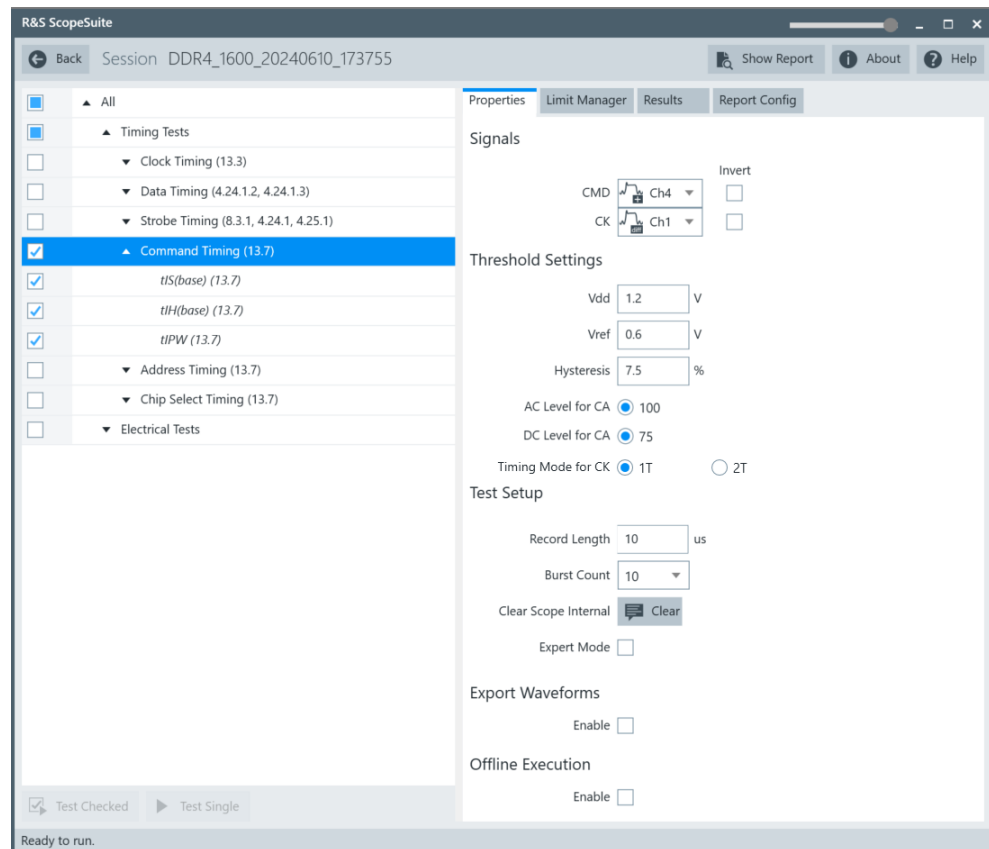

This test aims to verify that the strobe differential WRITE postamble is within the limits defined in section 4.25.1 (DDR4) of the specification.

4.4 Command timing**4.4.1 Test equipment**

Item	Description, model	Quantity
Rohde & Schwarz oscilloscope	R&S RTP with 4 channels and minimum 8 GHz bandwidth	1
Modular probe	probe with minimum 9 GHz bandwidth	2
Probe tip	R&S RT-ZMA10 or R&S RT-ZMA14	2
DUT	DDR4 device that supports the selected type	1

4.4.2 Performing the tests

1. Start the test as described in [Section 3.5, "Starting DDR4 tests"](#), on page 26.
2. Select "Timing Tests" > "Command Timing".

3. Enable the tests that you want to run.
4. Click "Test Single".
5. Follow the instructions of the step-by step guide.
When you have finished all steps, the compliance test runs automatically.
6. You can also run the test in offline mode, using downloaded waveforms. For details, see "[Offline Execution](#)" on page 25.

4.4.3 Test setup

The software guides you to make the proper connections. Follow the steps to conduct the test.

The software is intended to facilitate the execution of a set of measurements on the relevant signals.

Consider also the soldering guide, see [Section 2.1, "Test equipment"](#), on page 10.

4.4.4 Measurements

The command timing measurements consist of up to six measurements. They test the limits as defined in section 13.7 (DDR4) of the JESD79-4B(DDR4) specifications.

4.4.4.1 Address and control input setup time - t_{IS}

This test aims to verify that the command and address setup time from CK/CK# is within the limits defined in the specification.

4.4.4.2 Address and control input hold time - t_{IH}

This test aims to verify that the command and address hold time from CK/CK# is within the limits defined in the specification.

4.4.4.3 Address and control input pulse width t_{IPW}

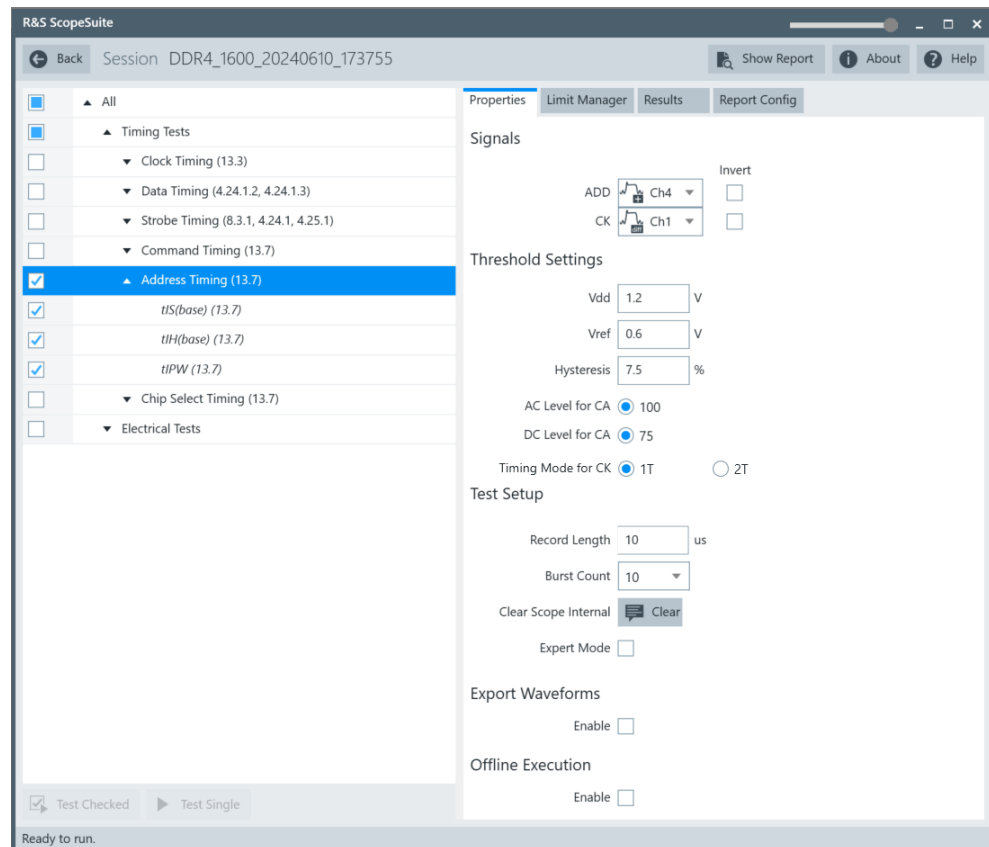

This test aims to verify that the control and address input pulse width for each input is within the limits defined in the specification.

4.5 Address timing**4.5.1 Test equipment**

Item	Description, model	Quantity
Rohde & Schwarz oscilloscope	R&S RTP with 4 channels and minimum 8 GHz bandwidth	1
Modular probe	probe with minimum 9 GHz bandwidth	2
Probe tip	R&S RT-ZMA10 or R&S RT-ZMA14	2
DUT	DDR4 device that supports the selected type	1

4.5.2 Performing the tests

1. Start the test as described in [Section 3.5, "Starting DDR4 tests"](#), on page 26.
2. Select "Timing Tests" > "Address Timing".

3. Enable the tests that you want to run.
4. Click "Test Single".
5. Follow the instructions of the step-by step guide.
When you have finished all steps, the compliance test runs automatically.
6. You can also run the test in offline mode, using downloaded waveforms. For details, see "[Offline Execution](#)" on page 25.

4.5.3 Test setup

The software guides you to make the proper connections. Follow the steps to conduct the test.

The software is intended to facilitate the execution of a set of measurements on the relevant signals.

Consider also the soldering guide, see [Section 2.1, "Test equipment"](#), on page 10.

4.5.4 Measurements

The address timing measurements consist of up to six measurements. They test the limits as defined in section 13.7 of the JESD79-4B(DDR4) specification.

For details on the measurements, see [Section 4.4.4, "Measurements"](#), on page 38.

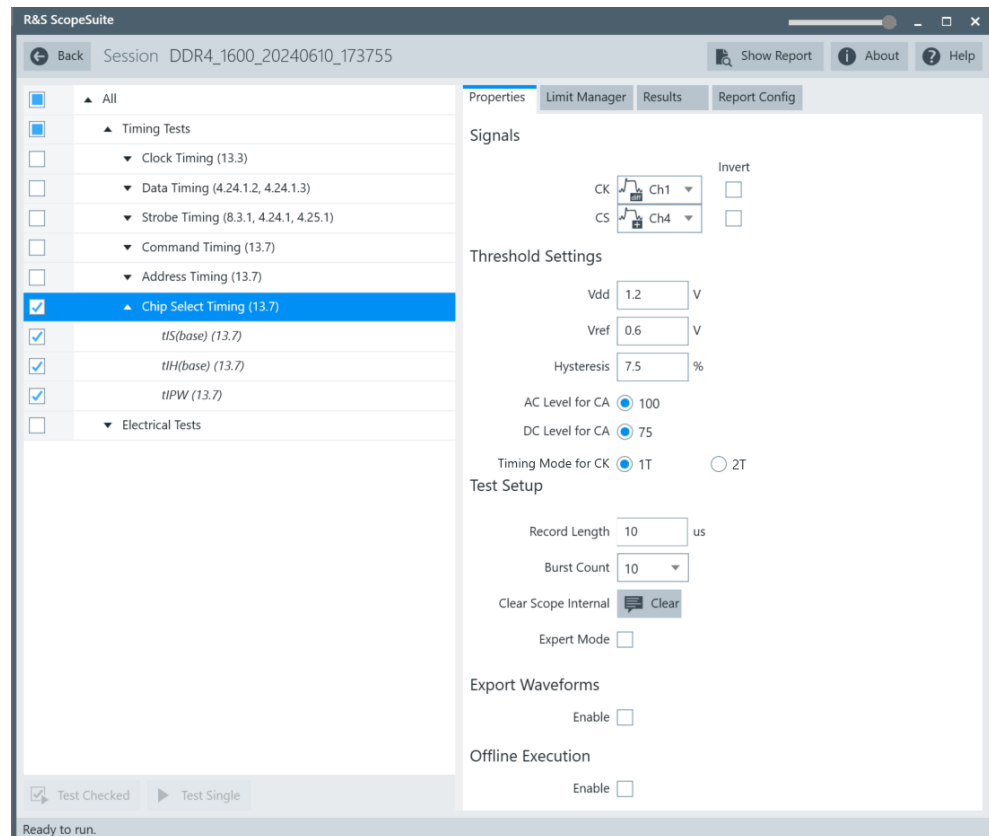

4.6 Chip select timing

4.6.1 Test equipment

Item	Description, model	Quantity
Rohde & Schwarz oscilloscope	R&S RTP with 4 channels and minimum 8 GHz bandwidth	1
Modular probe	probe with minimum 9 GHz bandwidth	2
Probe tip	R&S RT-ZMA10 or R&S RT-ZMA14	2
DUT	DDR4 device that supports the selected type	1

4.6.2 Performing the tests

1. Start the test as described in [Section 3.5, "Starting DDR4 tests"](#), on page 26.
2. Select "Timing Tests" > "Chip Select Timing".

3. Enable the tests that you want to run.
4. Click "Test Single".
5. Follow the instructions of the step-by-step guide.
When you have finished all steps, the compliance test runs automatically.
6. You can also run the test in offline mode, using downloaded waveforms. For details, see ["Offline Execution"](#) on page 25.

4.6.3 Test setup

The software guides you to make the proper connections. Follow the steps to conduct the test.

The software is intended to facilitate the execution of a set of measurements on the relevant signals.

Consider also the soldering guide, see [Section 2.1, "Test equipment"](#), on page 10.

4.6.4 Measurements

The chip select timing measurements consist of up to six measurements. They test the limits as defined in section 13.7 (DDR4) of the JESD79-4B(DDR4) specifications.

4.6.4.1 Address and control input setup time - t_{IS}

This test aims to verify that the chip select setup time from CK/CK# is within the limits defined in the specification.

4.6.4.2 Address and control input hold time - t_{IH}

This test aims to verify that the chip select hold time from CK/CK# is within the limits defined in the specification.

4.6.4.3 t_{IPW}

This test aims to verify that the chip select input pulse width for each input is within the limits defined in the specification.

5 Electrical tests

5.1 Single-ended signals

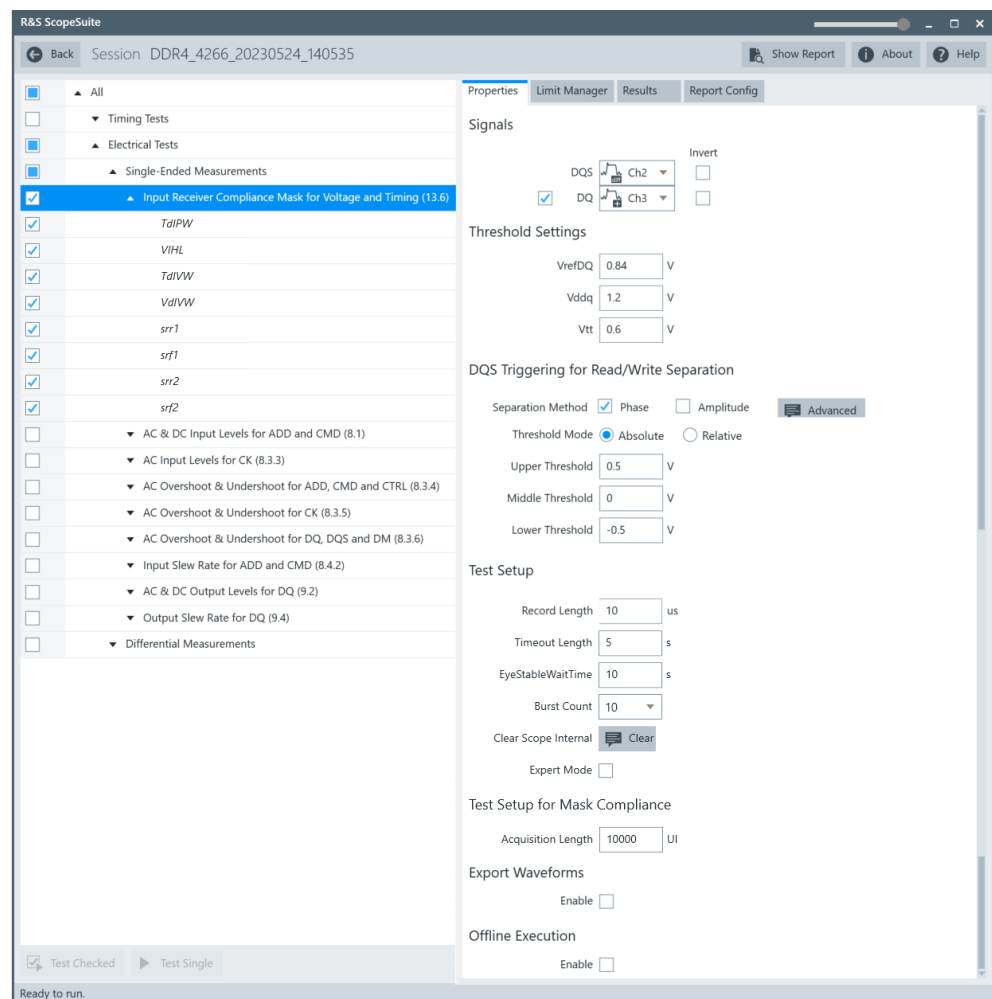

5.1.1 Input receiver compliance mask for voltage and timing

5.1.1.1 Test equipment

Item	Description, model	Quantity
Rohde & Schwarz oscilloscope	R&S RTP with 4 channels and minimum 8 GHz bandwidth	1
Modular probe	Probe with minimum 9 GHz bandwidth	2
Probe tip	R&S RT-ZMA10 or R&S RT-ZMA14	2
DUT	DDR4 device that supports the selected type	1

5.1.1.2 Performing the tests

1. Start the test as described in [Section 3.5, "Starting DDR4 tests"](#), on page 26.
2. Select "Electrical Tests" > "Single-Ended Signals" > "Input Receiver Compliance Mask for Voltage and Timing (13.6)".

3. If needed, set the parameters necessary for the test.
4. Click "Test Single".
5. Follow the instructions of the step-by step guide.
When you have finished all steps, the compliance test runs automatically.
6. You can also run the test in offline mode, using downloaded waveforms. For details, see ["Offline Execution"](#) on page 25.

5.1.1.3 Test setup

The software guides you to make the proper connections. Follow the steps to conduct the test.

The software is intended to facilitate the execution of a set of measurements on the relevant signals.

Consider also the soldering guide, see [Section 2.1, "Test equipment"](#), on page 10.

5.1.1.4 Measurements

The AC and DC logic input levels for single-ended address and command measurements consist of up to four measurements. It tests the limits as defined in section 13.6 (DDR4) of the JESD79-4B(DDR4) specification.

T_{dIPW}

This test aims to verify that the DQ input pulse width is within the limits defined in the specification.

V_{IHL}

This test aims to verify that V_{IHL} , the peak to peak voltage with respect to the Vcent_DQ level is within the limits defined in the specification.

T_{divw}

This test aims to verify that the width of the receiver's timing window (time domain) is within the limits defined in the specification.

V_{divw}

This test aims to verify that the peak-to-peak height of the receiver's mask voltage (voltage level) is within the limits defined in the specification.

srr1/ srr2

This tests aim to verify that the rising edge slew rates are within the limits defined in the specification.

srf1/srf2

This tests aim to verify that the falling edge slew rates are within the limits defined in the specification.

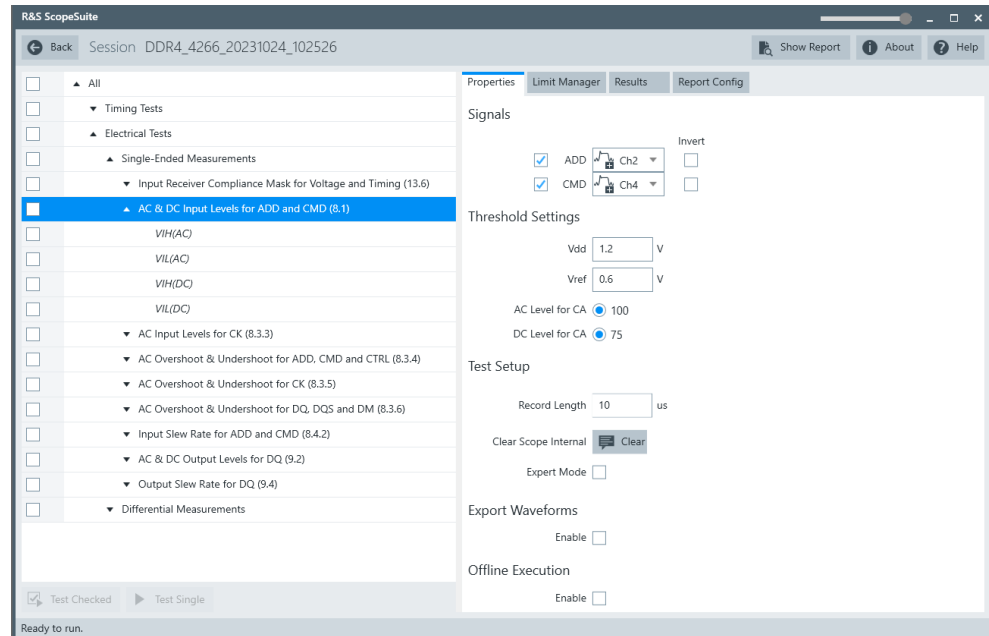

5.1.2 AC & DC input levels for ADD and CMD

5.1.2.1 Test equipment

Item	Description, model	Quantity
Rohde & Schwarz oscilloscope	R&S RTP with 4 channels and minimum 8 GHz bandwidth	1
Modular probe	Probe with minimum 9 GHz bandwidth	2
Probe tip	R&S RT-ZMA10 or R&S RT-ZMA14	2
DUT	DDR4 device that supports the selected type	1

5.1.2.2 Performing the tests

1. Start the test as described in [Section 3.5, "Starting DDR4 tests"](#), on page 26.
2. Select "Electrical Tests" > "Single-Ended Signals" > "AC & DC Input Levels for ADD and CMD".

3. Enable the "Signals" you want to use.
If only the ADD/CMD signal is selected, only ADD/CMD signal will be used to run the test.
If both the ADD and the CMD signals are selected, test will be run using ADD signal first, followed by the CMD signal.
4. Enable the tests that you want to run.
5. Click "Test Single".
6. Follow the instructions of the step-by step guide.
When you have finished all steps, the compliance test runs automatically.
7. You can also run the test in offline mode, using downloaded waveforms. For details, see ["Offline Execution"](#) on page 25.

5.1.2.3 Test setup

The software guides you to make the proper connections. Follow the steps to conduct the test.

The software is intended to facilitate the execution of a set of measurements on the relevant signals.

Consider also the soldering guide, see [Section 2.1, "Test equipment"](#), on page 10.

5.1.2.4 Measurements

The AC and DC logic input levels for single-ended address and command measurements consist of up to four measurements. It tests the limits as defined in section 8.1.1(DDR4) of the JESD79-4B(DDR4) specification.

$V_{IH(AC)}$

This test aims to verify that the AC input logic high is within the limits defined in the specification.

$V_{IL(AC)}$

This test aims to verify that the AC input logic low is within the limits defined in the specification.

$V_{IH(DC)}$

This test aims to verify that the DC input logic high is within the limits defined in the specification.

$V_{IL(DC)}$

This test aims to verify that the DC input logic low is within the limits defined in the specification.

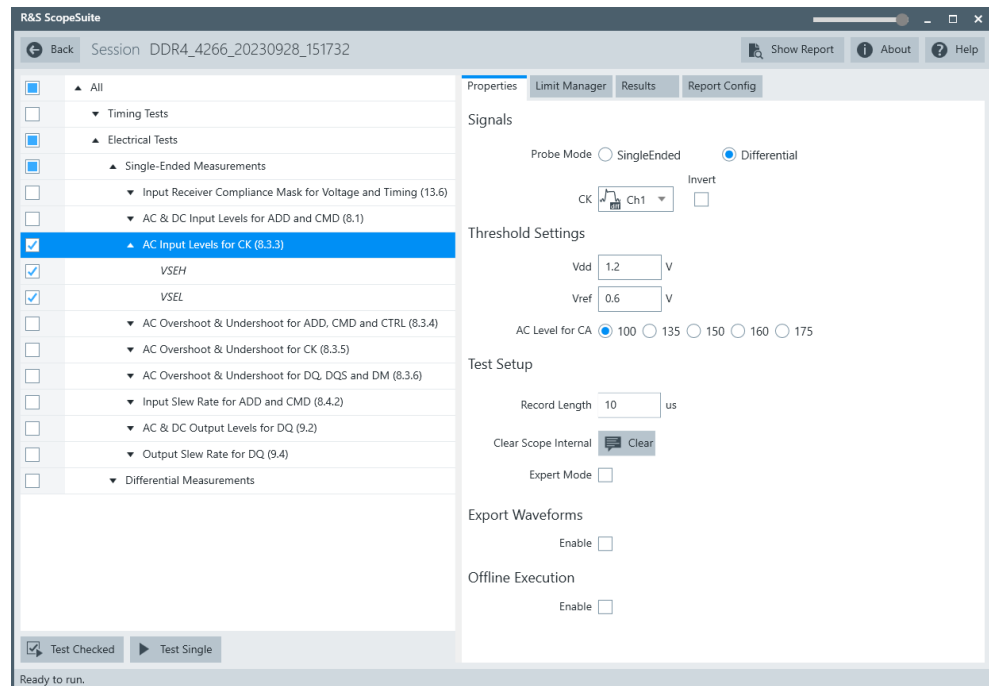

5.1.3 AC input levels for CK

5.1.3.1 Test equipment

Item	Description, model	Quantity
Rohde & Schwarz oscilloscope	R&S RTP with 4 channels and minimum 8 GHz bandwidth	1
Modular probe	Probe with minimum 9 GHz bandwidth	2
Probe tip	R&S RT-ZMA10 or R&S RT-ZMA14	2
DUT	DDR4 device that supports the selected type	1

5.1.3.2 Performing the tests

1. Start the test as described in [Section 3.5, "Starting DDR4 tests"](#), on page 26.
2. Select "Electrical Tests" > "Single-Ended Signals" > "AC Input Levels for CK".

3. Enable the tests that you want to run.
4. Click "Test Single".
5. Follow the instructions of the step-by step guide.
When you have finished all steps, the compliance test runs automatically.
6. You can also run the test in offline mode, using downloaded waveforms. For details, see ["Offline Execution"](#) on page 25.

5.1.3.3 Test setup

The software guides you to make the proper connections. Follow the steps to conduct the test.

The software is intended to facilitate the execution of a set of measurements on the relevant signals.

Consider also the soldering guide, see [Section 2.1, "Test equipment"](#), on page 10.

5.1.3.4 Measurements

The single-ended AC input levels for clock and strobe measurements consist of up to two measurements. It tests the limits as defined in section 8.3.3 (JESD79-4B(DDR4))/ 7.2.3 JESD209-4B(LPDDR4) of the specifications.

$V_{SEH(AC)}$

This test aims to verify that the single-ended high level for strobes/clock is within the limits defined in the specification.

$V_{SEL(AC)}$

This test aims to verify that the single-ended low level for strobes/clock is within the limits defined in the specification.

5.1.4 Output levels for DQ (LPDDR4/LPDDR4X)

This chapter is only relevant for LPDDR4/LPDDR4X tests.

5.1.4.1 Test equipment

Item	Description, model	Quantity
Rohde & Schwarz oscilloscope	R&S RTP with 4 channels and minimum 8 GHz bandwidth	1
Modular probe	Probe with minimum 9 GHz bandwidth	2
Probe tip	R&S RT-ZMA10 or R&S RT-ZMA14	2
DUT	DDR4 device that supports the selected type	1

5.1.4.2 Performing the tests

1. Start the test as described in [Section 3.5, "Starting DDR4 tests"](#), on page 26.
2. Select "Electrical Tests" > "Single-Ended Signals" > "Output Levels for DQ".

3. Enable the tests that you want to run.
4. Click "Test Single".
5. Follow the instructions of the step-by step guide.
When you have finished all steps, the compliance test runs automatically.
6. You can also run the test in offline mode, using downloaded waveforms. For details, see ["Offline Execution"](#) on page 25.

5.1.4.3 Test setup

The software guides you to make the proper connections. Follow the steps to conduct the test.

The software is intended to facilitate the execution of a set of measurements on the relevant signals.

Consider also the soldering guide, see [Section 2.1, "Test equipment"](#), on page 10.

5.1.4.4 Measurements

The single-ended output levels for strobe measurements consist of up to two measurements. It tests the limits as defined in section 7.4 of the JESD209-4B(LPDDR4) specification.

V_{OH}

This test aims to verify that the output high measurement level for the output slew rate is within the limits defined in the specification.

 V_{OL}

This test aims to verify that the output low measurement level for the output slew rate is within the limits defined in the specification.

5.1.5 AC overshoot & undershoot for ADD, CMD and CTRL (DDR4)

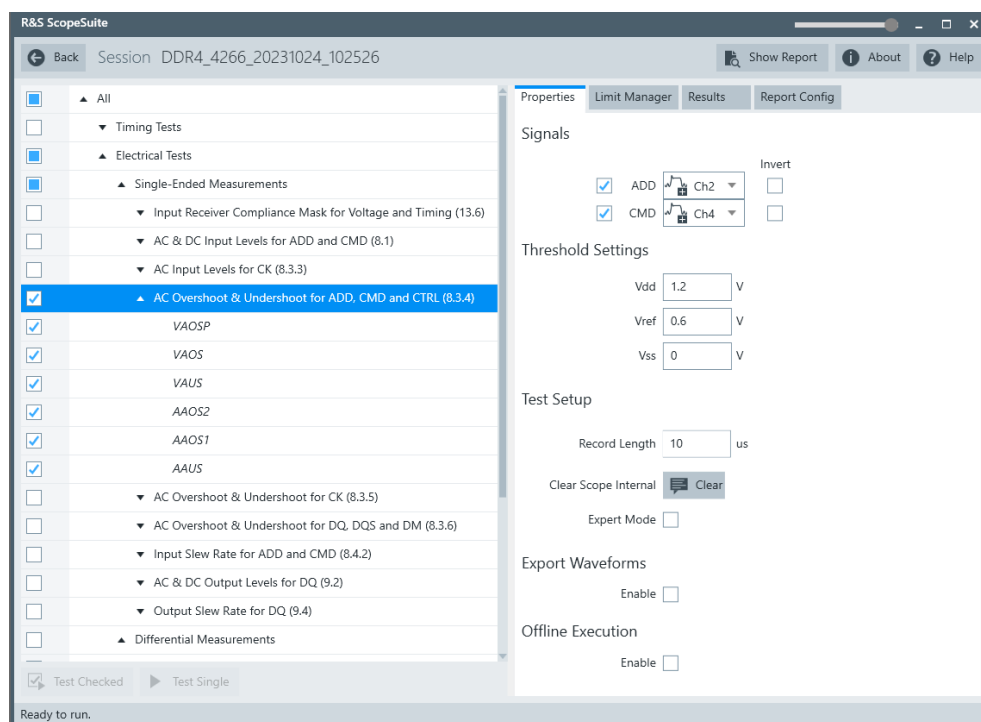

This chapter is only relevant for DDR4 tests.

5.1.5.1 Test equipment

Item	Description, model	Quantity
Rohde & Schwarz oscilloscope	R&S RTP with 4 channels and minimum 8 GHz bandwidth	1
Modular probe	Probe with minimum 9 GHz bandwidth	2
Probe tip	R&S RT-ZMA10 or R&S RT-ZMA14	2
DUT	DDR4 device that supports the selected type	1

5.1.5.2 Performing the tests

1. Start the test as described in [Section 3.5, "Starting DDR4 tests"](#), on page 26.
2. Select "Electrical Tests" > "Single-Ended Signals" > "AC Overshoot & Undershoot for ADD, CMD and CTRL".

3. Enable the "Signals" you want to use.
If only the ADD/CMD signal is selected, only ADD/CMD signal will be used to run the test.
If both the ADD and the CMD signals are selected, test will be run using ADD signal first, followed by the CMD signal.
4. Enable the tests that you want to run.
5. Click "Test Single".
6. Follow the instructions of the step-by step guide.
When you have finished all steps, the compliance test runs automatically.
7. You can also run the test in offline mode, using downloaded waveforms. For details, see ["Offline Execution"](#) on page 25.

5.1.5.3 Test setup

The software guides you to make the proper connections. Follow the steps to conduct the test.

The software is intended to facilitate the execution of a set of measurements on the relevant signals.

Consider also the soldering guide, see [Section 2.1, "Test equipment"](#), on page 10.

5.1.5.4 Measurements

The overshoot and undershoot for address and control measurements consist of up to six measurements. It tests the limits as defined in section 8.3.4 of the JESD79-4B(DDR4) specification.

V_{AOSP}

This test aims to verify that the maximum peak amplitude above V_{AOS} is within the limits defined in the specification.

V_{AOS}

This test aims to verify that the upper boundary of overshoot area A_{AOS1} is within the limits defined in the specification.

V_{AUS}

This test aims to verify that the maximum peak amplitude allowed for undershoot is within the limits defined in the specification.

A_{AOS2}

This test aims to verify that the maximum overshoot area per 1 t_{CK} above V_{AOS} is within the limits defined in the specification.

A_{AOS1}

This test aims to verify that the maximum overshoot area per 1 t_{CK} between VDD and V_{AOS} is within the limits defined in the specification.

A_{AUS}

This test aims to verify that the maximum undershoot area per 1 t_{CK} below VSS is within the limits defined in the specification.

A_{AOS}

This test aims to verify that the maximum overshoot area per 1 t_{CK} below VSS is within the limits defined in the specification.

5.1.6 AC overshoot & undershoot for ADD and CTRL (LPDDR4/LPDDR4X)

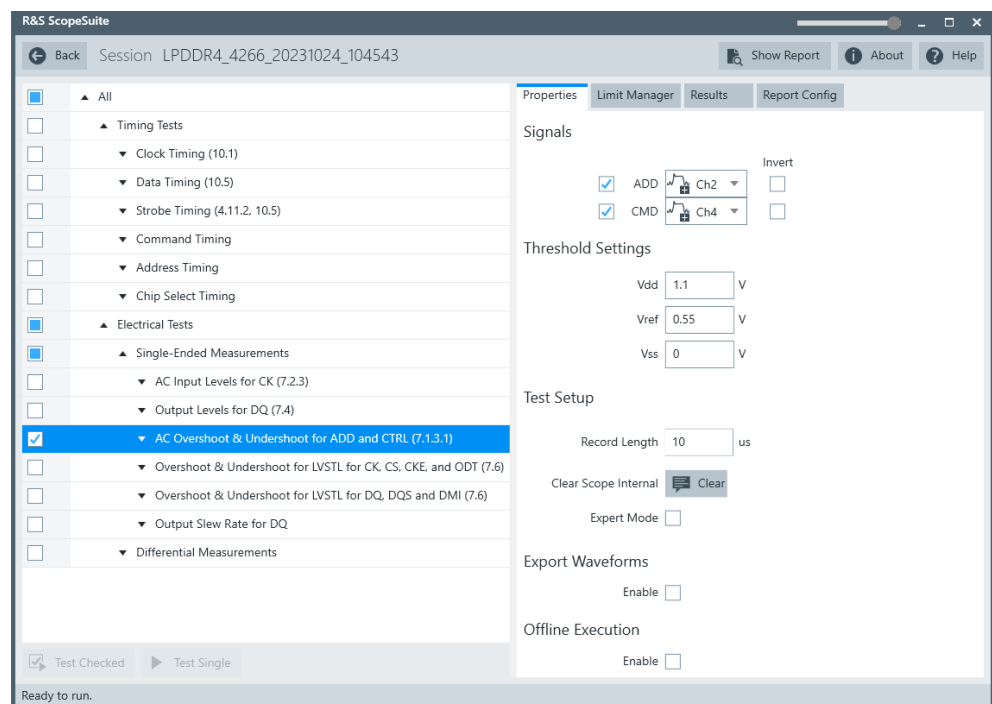

This chapter is only relevant for LPDDR4/LPDDR4X tests.

5.1.6.1 Test equipment

Item	Description, model	Quantity
Rohde & Schwarz oscilloscope	R&S RTP with 4 channels and minimum 8 GHz bandwidth	1
Modular probe	Probe with minimum 9 GHz bandwidth	2
Probe tip	R&S RT-ZMA10 or R&S RT-ZMA14	2
DUT	DDR4 device that supports the selected type	1

5.1.6.2 Performing the tests

1. Start the test as described in [Section 3.5, "Starting DDR4 tests"](#), on page 26.
2. Select "Electrical Tests" > "Single-Ended Signals" > "AC Overshoot & Undershoot for ADD and CTRL".

3. Enable the "Signals" you want to use.
If only the ADD/CMD signal is selected, only ADD/CMD signal will be used to run the test.
If both the ADD and the CMD signals are selected, test will be run using ADD signal first, followed by the CMD signal.
4. Enable the tests that you want to run.
5. Click "Test Single".

6. Follow the instructions of the step-by step guide.
When you have finished all steps, the compliance test runs automatically.
7. You can also run the test in offline mode, using downloaded waveforms. For details, see ["Offline Execution"](#) on page 25.

5.1.6.3 Test setup

The software guides you to make the proper connections. Follow the steps to conduct the test.

The software is intended to facilitate the execution of a set of measurements on the relevant signals.

Consider also the soldering guide, see [Section 2.1, "Test equipment"](#), on page 10.

5.1.6.4 Measurements

The overshoot and undershoot for address and control measurements consist of up to four measurements. It tests the limits as defined in section 7.1.3.1 of the JESD209-4B(LPDDR4) specification.

For details on the measurements, see [Section 5.1.5.4, "Measurements"](#), on page 54.

V_{AOS}

This test aims to verify that the upper boundary of overshoot area A_{AOS} is within the limits defined in the specification.

V_{AUS}

This test aims to verify that the maximum peak amplitude allowed for undershoot is within the limits defined in the specification.

A_{AOS}

This test aims to verify that the maximum overshoot area per $1 t_{CK}$ below VSS is within the limits defined in the specification.

A_{AUS}

This test aims to verify that the maximum undershoot area per $1 t_{CK}$ below VSS is within the limits defined in the specification.

5.1.7 AC overshoot & undershoot for CK

This chapter is only relevant for DDR4 tests.

5.1.7.1 Test equipment

Item	Description, model	Quantity
Rohde & Schwarz oscilloscope	R&S RTP with 4 channels and minimum 8 GHz bandwidth	1
Modular probe	Probe with minimum 9 GHz bandwidth	1
Probe tip	R&S RT-ZMA10 or R&S RT-ZMA14	1
DUT	DDR4 device that supports the selected type	1

5.1.7.2 Performing the tests

1. Start the test as described in [Section 3.5, "Starting DDR4 tests"](#), on page 26.
2. Select "Electrical Tests" > "Single-Ended Signals" > "AC Overshoot & Undershoot for CK".

3. Enable the tests that you want to run.
4. Click "Test Single".
5. Follow the instructions of the step-by step guide.
When you have finished all steps, the compliance test runs automatically.
6. You can also run the test in offline mode, using downloaded waveforms. For details, see ["Offline Execution"](#) on page 25.

5.1.7.3 Test setup

The software guides you to make the proper connections. Follow the steps to conduct the test.

The software is intended to facilitate the execution of a set of measurements on the relevant signals.

Consider also the soldering guide, see [Section 2.1, "Test equipment"](#), on page 10.

5.1.7.4 Measurements

The overshoot and undershoot for clock measurements consist of up to six measurements. It tests the limits as defined in section 8.3.5 (DDR4) of the JESD79-4B(DDR4) specification.

V_{COSP}

This test aims to verify that the maximum peak amplitude above V_{COS} is within the limits defined in the specification.

V_{COS}

This test aims to verify that the upper boundary of overshoot area A_{DOS1} is within the limits defined in the specification.

V_{CUS}

This test aims to verify that the maximum peak amplitude allowed for undershoot is within the limits defined in the specification.

A_{COS2}

This test aims to verify that the maximum overshoot area per 1 UI above V_{COS} is within the limits defined in the specification.

A_{COS1}

This test aims to verify that the maximum overshoot area per 1 UI between VDD and V_{AOS} is within the limits defined in the specification.

A_{COS}

This test aims to verify that the maximum overshoot area is within the limits defined in the specification.

A_{CUS}

This test aims to verify that the maximum undershoot area per 1 UI below VSS is within the limits defined in the specification.

5.1.8 Overshoot & undershoot for LVSTL for CK, CS, CKE and ODT

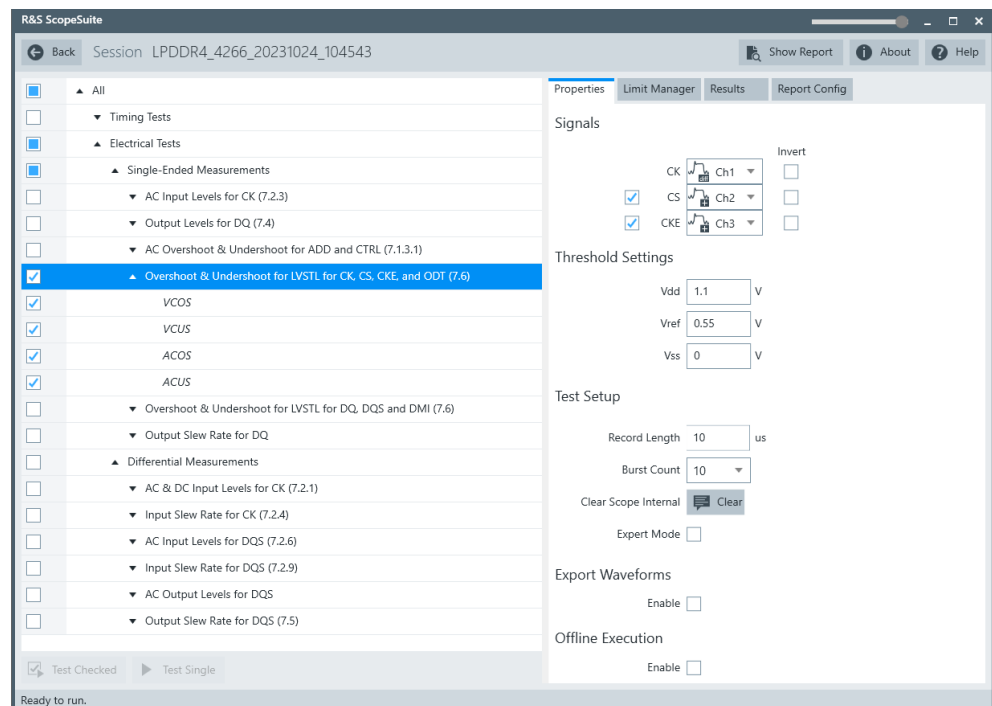

This chapter is only relevant for LPDDR4/LPDDR4X tests.

5.1.8.1 Test equipment

Item	Description, model	Quantity
Rohde & Schwarz oscilloscope	R&S RTP with 4 channels and minimum 8 GHz bandwidth	1
Modular probe	Probe with minimum 9 GHz bandwidth	3
Probe tip	R&S RT-ZMA10 or R&S RT-ZMA14	3
DUT	DDR4 device that supports the selected type	1

5.1.8.2 Performing the tests

1. Start the test as described in [Section 3.5, "Starting DDR4 tests"](#), on page 26.
2. Select "Electrical Tests" > "Single-Ended Signals" > "Overshoot & Undershoot for LVSTL for CK, CS, CKE and ODT".

3. Enable the tests that you want to run.
4. Click "Test Single".
5. Follow the instructions of the step-by step guide.
When you have finished all steps, the compliance test runs automatically.

- You can also run the test in offline mode, using downloaded waveforms. For details, see ["Offline Execution"](#) on page 25.

5.1.8.3 Test setup

The software guides you to make the proper connections. Follow the steps to conduct the test.

The software is intended to facilitate the execution of a set of measurements on the relevant signals.

Consider also the soldering guide, see [Section 2.1, "Test equipment"](#), on page 10.

5.1.8.4 Measurements

The overshoot and undershoot for clock measurements consist of up to four measurements. It tests the limits as defined in section 7.6 of the JESD209-4B(LPDDR4) specification.

For details on the measurements, see [Section 5.1.7.4, "Measurements"](#), on page 58.

5.1.9 AC overshoot & undershoot for DQ, DQS, and DM

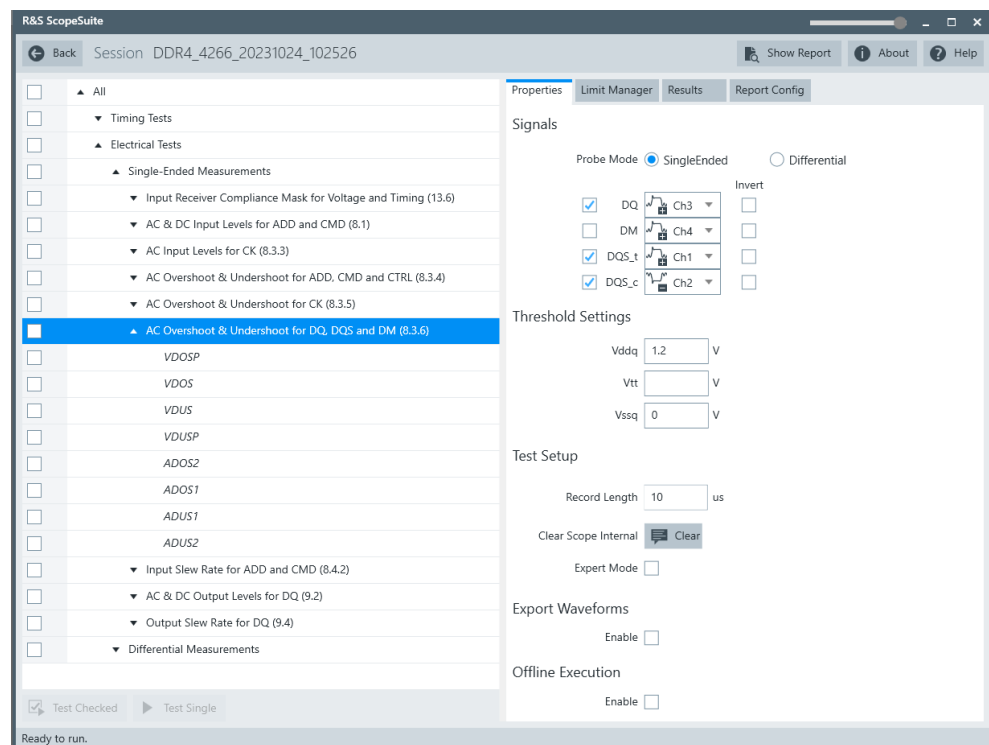

This chapter is only relevant for DDR4 tests.

5.1.9.1 Test equipment

Item	Description, model	Quantity
Rohde & Schwarz oscilloscope	R&S RTP with 4 channels and minimum 8 GHz bandwidth	1
Modular probe	Probe with minimum 9 GHz bandwidth	2/3
Probe tip	R&S RT-ZMA10 or R&S RT-ZMA14	2/3
DUT	DDR4 device that supports the selected type	1

5.1.9.2 Performing the tests

- Start the test as described in [Section 3.5, "Starting DDR4 tests"](#), on page 26.
- Select "Electrical Tests" > "Single-Ended Signals" > "AC Overshoot & Undershoot for DQ, DQS, and DM".

3. Enable the tests that you want to run.
4. Click "Test Single".
5. Follow the instructions of the step-by step guide.
When you have finished all steps, the compliance test runs automatically.
6. You can also run the test in offline mode, using downloaded waveforms. For details, see ["Offline Execution"](#) on page 25.

5.1.9.3 Test setup

The software guides you to make the proper connections. Follow the steps to conduct the test.

The software is intended to facilitate the execution of a set of measurements on the relevant signals.

Consider also the soldering guide, see [Section 2.1, "Test equipment"](#), on page 10.

5.1.9.4 Measurements

The overshoot and undershoot for data, strobe and mask measurements consist of up to 8 measurements. It tests the limits as defined in section 8.3.6 of the JESD79-4B(DDR4) specification.

V_{DOSP}

This test aims to verify that the maximum peak amplitude above V_{DOS} is within the limits defined in the specification.

 V_{DOS}

This test aims to verify that the upper boundary of overshoot area A_{DOS1} is within the limits defined in the specification.

 V_{DUS}

This test aims to verify that the lower boundary of undershoot area is within the limits defined in the specification.

 V_{DUSP}

This test aims to verify that the maximum peak amplitude below V_{DUS} is within the limits defined in the specification.

 A_{DOS2}

This test aims to verify that the maximum overshoot area per 1 UI above V_{DOS} is within the limits defined in the specification.

 A_{DOS1}

This test aims to verify that the maximum overshoot area per 1 UI between V_{DDQ} and V_{DOS} is within the limits defined in the specification.

 A_{DUS1}

This test aims to verify that the maximum undershoot area per 1 UI between V_{SSQ} and V_{DUS1} is within the limits defined in the specification.

 A_{DUS2}

This test aims to verify that the maximum undershoot area per 1 UI below V_{DUS} is within the limits defined in the specification.

5.1.10 Overshoot & undershoot for LVSTL for DQ, DQS, and DMI

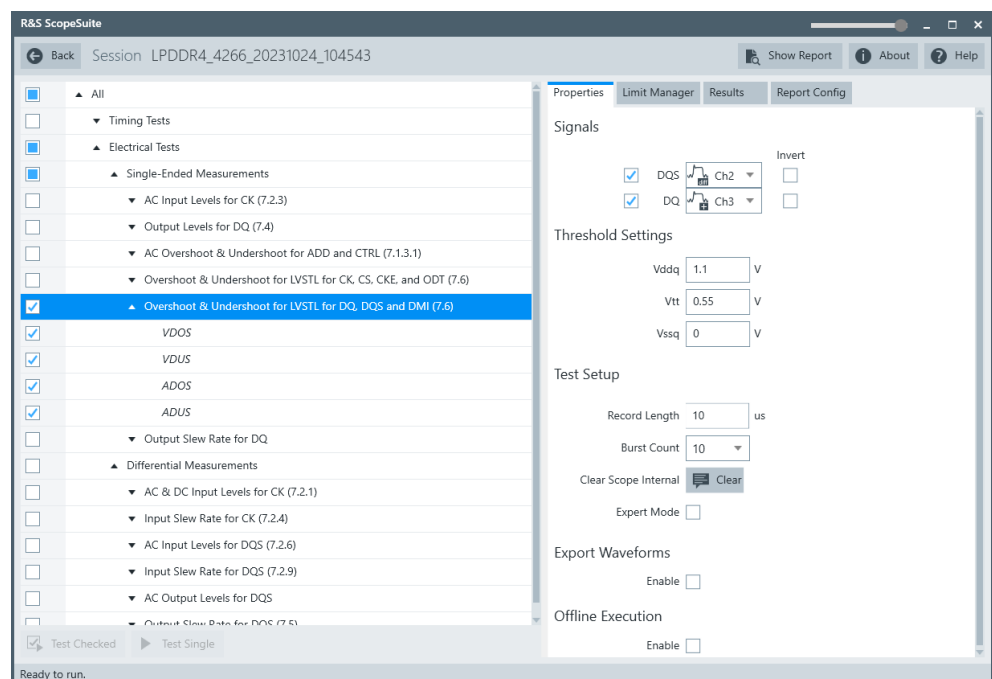

This chapter is only relevant for LPDDR4/LPDDR4X tests.

5.1.10.1 Test equipment

Item	Description, model	Quantity
Rohde & Schwarz oscilloscope	R&S RTP with 4 channels and minimum 8 GHz bandwidth	1
Modular probe	Probe with minimum 9 GHz bandwidth	2
Probe tip	R&S RT-ZMA10 or R&S RT-ZMA14	2
DUT	DDR4 device that supports the selected type	1

5.1.10.2 Performing the tests

1. Start the test as described in [Section 3.5, "Starting DDR4 tests"](#), on page 26.
2. Select "Electrical Tests" > "Single-Ended Signals" > "Overshoot & Undershoot for LVSTL for DQ, DQS, and DMI".

3. Enable the tests that you want to run.
4. Click "Test Single".
5. Follow the instructions of the step-by step guide.
When you have finished all steps, the compliance test runs automatically.
6. You can also run the test in offline mode, using downloaded waveforms. For details, see ["Offline Execution"](#) on page 25.

5.1.10.3 Test setup

The software guides you to make the proper connections. Follow the steps to conduct the test.

The software is intended to facilitate the execution of a set of measurements on the relevant signals.

Consider also the soldering guide, see [Section 2.1, "Test equipment"](#), on page 10.

5.1.10.4 Measurements

The overshoot and undershoot for clock measurements consist of up to four measurements. It tests the limits as defined in section 7.6 of the JESD209-4B(LPDDR4) specification.

For details on the measurements, see [Section 5.1.9.4, "Measurements"](#), on page 61.

5.1.11 Input slew rate for ADD and CMD

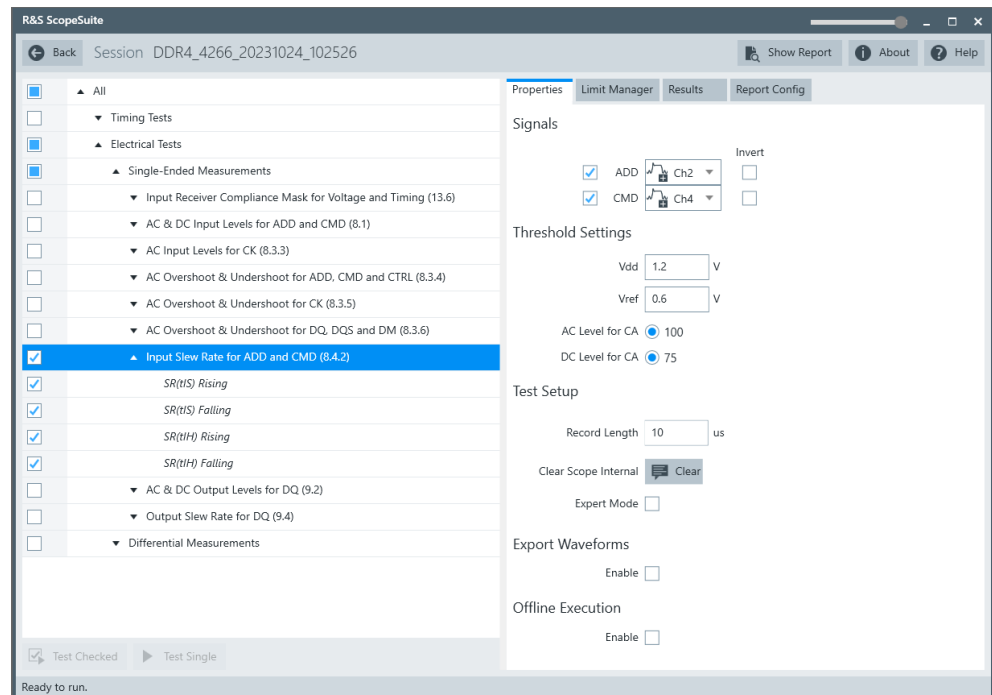

This chapter is only relevant for DDR4 tests.

5.1.11.1 Test equipment

Item	Description, model	Quantity
Rohde & Schwarz oscilloscope	R&S RTP with 4 channels and minimum 8 GHz bandwidth	1
Modular probe	Probe with minimum 9 GHz bandwidth	2
Probe tip	R&S RT-ZMA10 or R&S RT-ZMA14	2
DUT	DDR4 device that supports the selected type	1

5.1.11.2 Performing the tests

1. Start the test as described in [Section 3.5, "Starting DDR4 tests"](#), on page 26.
2. Select "Electrical Tests" > "Single-Ended Signals" > "Input Slew Rate for ADD and CMD".

3. Enable the "Signals" you want to use.
If only the ADD/CMD signal is selected, only ADD/CMD signal will be used to run the test.
If both the ADD and the CMD signals are selected, test will be run using ADD signal first, followed by the CMD signal.
4. Enable the tests that you want to run.
5. Click "Test Single".
6. Follow the instructions of the step-by step guide.
When you have finished all steps, the compliance test runs automatically.
7. You can also run the test in offline mode, using downloaded waveforms. For details, see ["Offline Execution"](#) on page 25.

5.1.11.3 Test setup

The software guides you to make the proper connections. Follow the steps to conduct the test.

The software is intended to facilitate the execution of a set of measurements on the relevant signals.

Consider also the soldering guide, see [Section 2.1, "Test equipment"](#), on page 10.

5.1.11.4 Measurements

The input slew rates for address and command measurements consist of up to four measurements. It tests the limits as defined in sections 8.3.6 of the JESD79-4B(DDR4) specification.

Setup slew rate rising - SR(tIS) rising

This test aims to verify that the setup slew rate for rising signal is within the limits defined in the specification.

Setup slew rate falling - SR(tIS) falling

This test aims to verify that the setup slew rate for falling signal is within the limits defined in the specification.

Hold slew rate rising - SR(tIH) rising

This test aims to verify that the hold slew rate for rising signal is within the limits defined in the specification.

Hold slew rate falling - SR(tIH) falling

This test aims to verify that the hold slew rate for falling signal is within the limits defined in the specification.

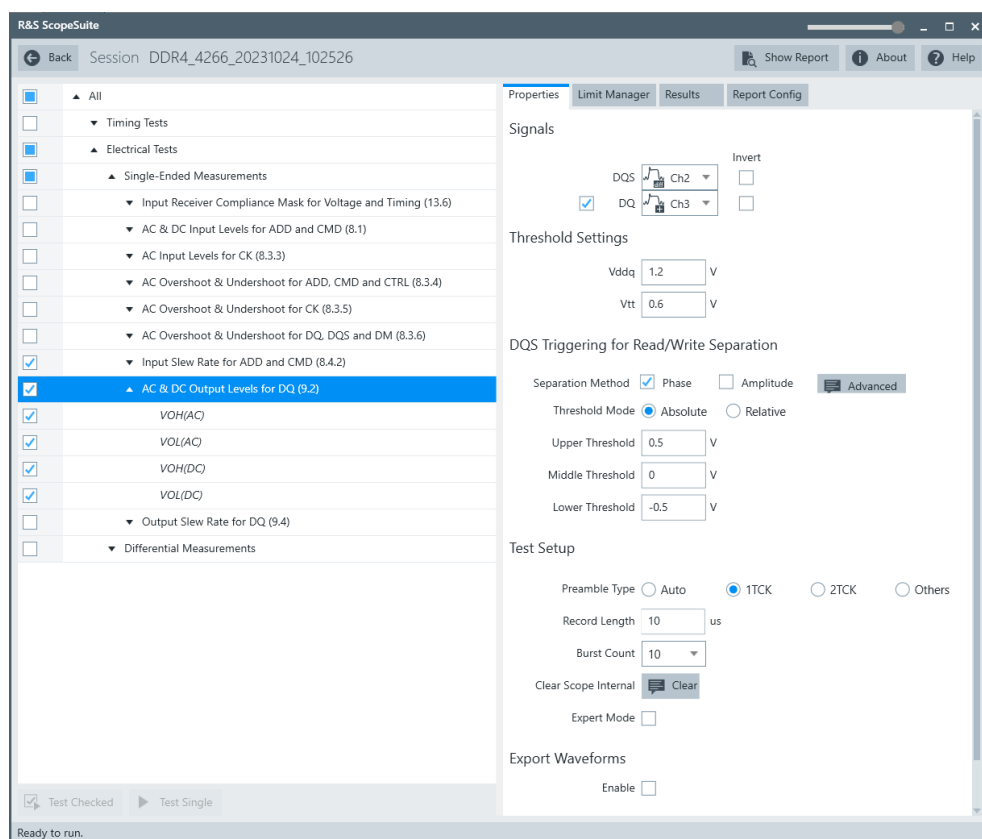

5.1.12 AC & DC output levels for DQ

5.1.12.1 Test equipment

Item	Description, model	Quantity
Rohde & Schwarz oscilloscope	R&S RTP with 4 channels and minimum 8 GHz bandwidth	1
Modular probe	Probe with minimum 9 GHz bandwidth	2
Probe tip	R&S RT-ZMA10 or R&S RT-ZMA14	2
DUT	DDR4 device that supports the selected type	1

5.1.12.2 Performing the tests

1. Start the test as described in [Section 3.5, "Starting DDR4 tests"](#), on page 26.
2. Select "Electrical Tests" > "Single-Ended Signals" > "AC & DC Output Levels for DQ".

3. Enable the tests that you want to run.
4. Click "Test Single".
5. Follow the instructions of the step-by step guide.
When you have finished all steps, the compliance test runs automatically.
6. You can also run the test in offline mode, using downloaded waveforms. For details, see ["Offline Execution"](#) on page 25.

5.1.12.3 Test setup

The software guides you to make the proper connections. Follow the steps to conduct the test.

The software is intended to facilitate the execution of a set of measurements on the relevant signals.

Consider also the soldering guide, see [Section 2.1, "Test equipment"](#), on page 10.

5.1.12.4 Measurements

The AC & DC output levels for data measurements consist of up to four measurements. It tests the limits as defined in section 9.2 of the JESD79-4B(DDR4) specifications.

$V_{OH(AC)}$

This test aims to verify that the AC output high measurement level for the output slew rate is within the limits defined in the specification.

 $V_{OL(AC)}$

This test aims to verify that the AC output low measurement level for the output slew rate is within the limits defined in the specification.

 $V_{OH(DC)}$

This test aims to verify that the DC output high measurement level for IV curve linearity is within the limits defined in the specification.

 $V_{OL(DC)}$

This test aims to verify that the DC output low measurement level for IV curve linearity is within the limits defined in the specification.

5.1.13 Output slew rate for DQ

5.1.13.1 Test equipment

Item	Description, model	Quantity
Rohde & Schwarz oscilloscope	R&S RTP with 4 channels and minimum 8 GHz bandwidth	1
Modular probe	Probe with minimum 9 GHz bandwidth	2
Probe tip	R&S RT-ZMA10 or R&S RT-ZMA14	2
DUT	DDR4 device that supports the selected type	1

5.1.13.2 Performing the tests

1. Start the test as described in [Section 3.5, "Starting DDR4 tests"](#), on page 26.
2. Select "Electrical Tests" > "Single-Ended Signals" > "Output Slew Rate for DQ".

3. Enable the tests that you want to run.
4. Click "Test Single".
5. Follow the instructions of the step-by step guide.
When you have finished all steps, the compliance test runs automatically.
6. You can also run the test in offline mode, using downloaded waveforms. For details, see ["Offline Execution"](#) on page 25.

5.1.13.3 Test setup

The software guides you to make the proper connections. Follow the steps to conduct the test.

The software is intended to facilitate the execution of a set of measurements on the relevant signals.

Consider also the soldering guide, see [Section 2.1, "Test equipment"](#), on page 10.

5.1.13.4 Measurements

The single-ended output slew rate for data consists of up to two measurements. It tests the limits as defined in section 9.4 (DDR4) / 7.4 (LPDDR4) / 4.2 (LPDDR4X) of the JESD79-4B(DDR4)/ JESD209-4B(LPDDR4)/JESD209-4-1(LPDDR4X) specifications.

Slew rate query output single-ended signals rising- SRQse rising

This test aims to verify that the single-ended output slew rate for rising edge is within the limits defined in the specification. It is measured from VOL(AC) to VOH(AC).

Slew rate query output single-ended signals falling - SRQse falling

This test aims to verify that the single-ended output slew rate for falling edge is within the limits defined in the specification. It is measured from VOH(AC) to VOL(AC).

5.2 Differential signals

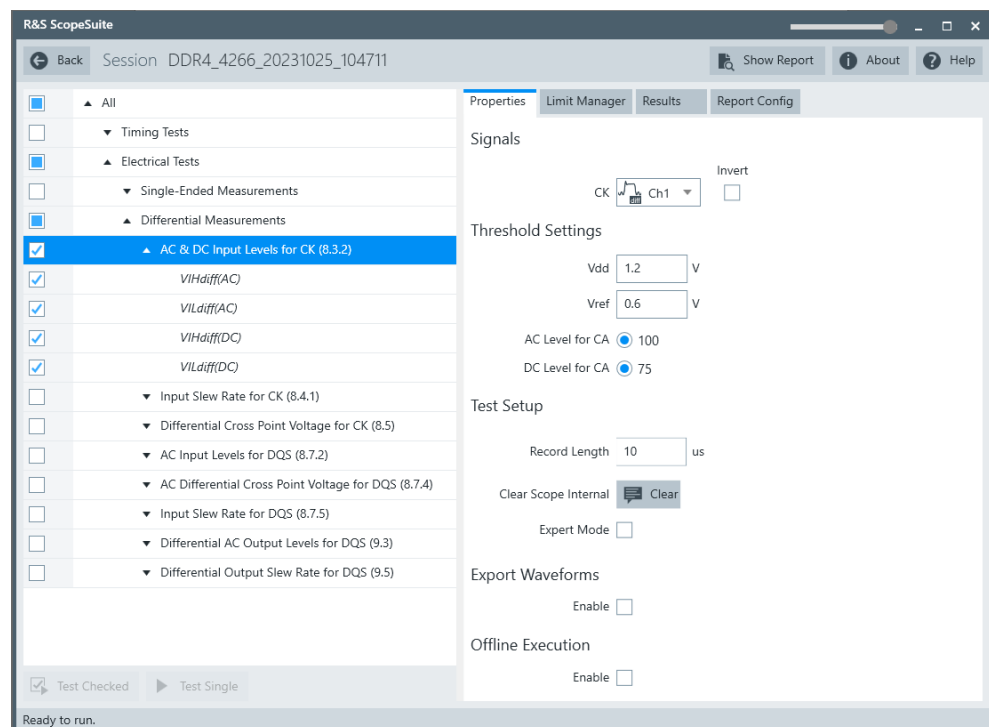

5.2.1 AC & DC input levels for CK

5.2.1.1 Test equipment

Item	Description, model	Quantity
Rohde & Schwarz oscilloscope	R&S RTP with 4 channels and minimum 8 GHz bandwidth	1
Modular probe	Probe with minimum 9 GHz bandwidth	1
Probe tip	R&S RT-ZMA10 or R&S RT-ZMA14	1
DUT	DDR4 device that supports the selected type	1

5.2.1.2 Performing the tests

1. Start the test as described in [Section 3.5, "Starting DDR4 tests"](#), on page 26.
2. Select "Electrical Tests" > "Differential Signals" > "AC & DC Input Levels for CK".

3. Enable the tests that you want to run.
4. Click "Test Single".
5. Follow the instructions of the step-by step guide.
When you have finished all steps, the compliance test runs automatically.
6. You can also run the test in offline mode, using downloaded waveforms. For details, see ["Offline Execution"](#) on page 25.

5.2.1.3 Test setup

The software guides you to make the proper connections. Follow the steps to conduct the test.

The software is intended to facilitate the execution of a set of measurements on the relevant signals.

Consider also the soldering guide, see [Section 2.1, "Test equipment"](#), on page 10.

5.2.1.4 Measurements

The differential AC input levels for clock and strobe measurements consist of up to two measurements. It tests the limits as defined in section 8.3.2 (JESD79-4B(DDR4)) / 7.2.1 (JESD209-4B(LPDDR4)) of the specifications.

Differential input high AC - $V_{IHdiff(AC)}$

This test aims to verify that the AC differential input high is within the limits defined in the specification.

Differential input low AC - $V_{ILdiff(AC)}$

This test aims to verify that the AC differential input low is within the limits defined in the specification.

Differential input high DC - $V_{IHdiff(DC)}$

This test aims to verify that the DC differential input high is within the limits defined in the specification.

Differential input low DC - $V_{ILdiff(DC)}$

This test aims to verify that the DC differential input low is within the limits defined in the specification.

5.2.2 Input slew rate for CK**5.2.2.1 Test equipment**

Item	Description, model	Quantity
Rohde & Schwarz oscilloscope	R&S RTP with 4 channels and minimum 8 GHz bandwidth	1
Modular probe	Probe with minimum 9 GHz bandwidth	1
Probe tip	R&S RT-ZMA10 or R&S RT-ZMA14	1
DUT	DDR4 device that supports the selected type	1

5.2.2.2 Performing the tests

1. Start the test as described in [Section 3.5, "Starting DDR4 tests"](#), on page 26.
2. Select "Electrical Tests" > "Single-Ended Signals" > "Input Slew Rate for CK".

3. Enable the tests that you want to run.
4. Click "Test Single".
5. Follow the instructions of the step-by step guide.
When you have finished all steps, the compliance test runs automatically.
6. You can also run the test in offline mode, using downloaded waveforms. For details, see ["Offline Execution"](#) on page 25.

5.2.2.3 Test setup

The software guides you to make the proper connections. Follow the steps to conduct the test.

The software is intended to facilitate the execution of a set of measurements on the relevant signals.

Consider also the soldering guide, see [Section 2.1, "Test equipment"](#), on page 10.

5.2.2.4 Measurements

The input slew rates for clock measurements consist of up to two measurements. It tests the limits as defined in sections 8.4.1 (DDR4)/ 7.2.4 (LPDDR4/LPDDR4X) of the JESD79-4B(DDR4)/ (JESD209-4B(LPDDR4)) specifications.

Differential input slew rate rising - SR(diff) rising

This test aims to verify that the setup slew rate for rising signal is within the limits defined in the specification.

Differential input slew rate falling - SR(diff) falling

This test aims to verify that the setup slew rate for falling signal is within the limits defined in the specification.

5.2.3 Differential cross point voltage for CK

This chapter is only relevant for DDR4 tests.

5.2.3.1 Test equipment

Item	Description, model	Quantity
Rohde & Schwarz oscilloscope	R&S RTP with 4 channels and minimum 8 GHz bandwidth	1
Modular probe	Probe with minimum 9 GHz bandwidth	1
Probe tip	R&S RT-ZMA10 or R&S RT-ZMA14	1
DUT	DDR4 device that supports the selected type	1

5.2.3.2 Performing the tests

1. Start the test as described in [Section 3.5, "Starting DDR4 tests"](#), on page 26.
2. Select "Electrical Tests" > "Differential Signals" > "Differential Cross Point Voltage for CK".

3. Enable the tests that you want to run.
4. Click "Test Single".
5. Follow the instructions of the step-by step guide.
When you have finished all steps, the compliance test runs automatically.
6. You can also run the test in offline mode, using downloaded waveforms. For details, see ["Offline Execution"](#) on page 25.

5.2.3.3 Test setup

The software guides you to make the proper connections. Follow the steps to conduct the test.

The software is intended to facilitate the execution of a set of measurements on the relevant signals.

Consider also the soldering guide, see [Section 2.1, "Test equipment"](#), on page 10.

5.2.3.4 Measurements

The differential cross point voltage for clock measurement consists of one measurement. It tests the limits as defined in section 8.5 of the JESD79-4B(DDR4) specification.

Differential input cross point voltage - $V_{IX(CK)}$

This test aims to verify that the differential input cross point voltage is within the limits defined in the specification. It is measured from the actual cross point of true and complement signals to the midlevel between of VDD and VSS.

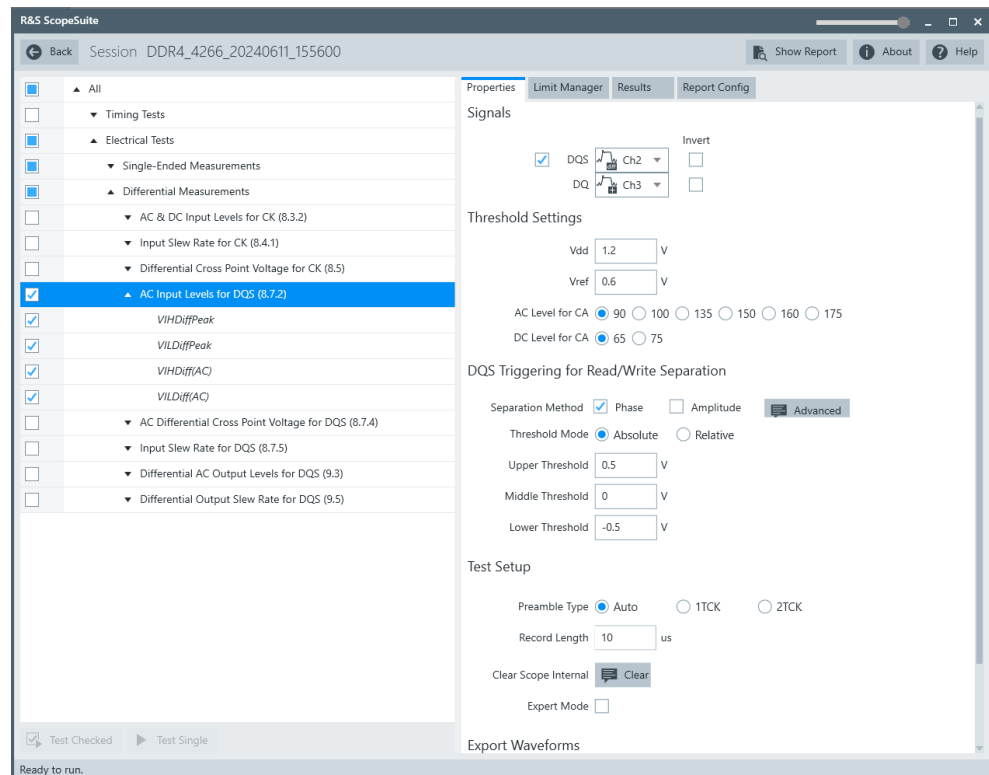

5.2.4 AC input levels for DQS

5.2.4.1 Test equipment

Item	Description, model	Quantity
Rohde & Schwarz oscilloscope	R&S RTP with 4 channels and minimum 8 GHz bandwidth	1
Modular probe	Probe with minimum 9 GHz bandwidth	2
Probe tip	R&S RT-ZMA10 or R&S RT-ZMA14	2
DUT	DDR4 device that supports the selected type	1

5.2.4.2 Performing the tests

1. Start the test as described in [Section 3.5, "Starting DDR4 tests"](#), on page 26.
2. Select "Electrical Tests" > "Differential Signals" > "AC Input Levels for DQS".

3. Enable the tests that you want to run.
4. Click "Test Single".
5. Follow the instructions of the step-by step guide.
When you have finished all steps, the compliance test runs automatically.
6. You can also run the test in offline mode, using downloaded waveforms. For details, see ["Offline Execution"](#) on page 25.

5.2.4.3 Test setup

The software guides you to make the proper connections. Follow the steps to conduct the test.

The software is intended to facilitate the execution of a set of measurements on the relevant signals.

Consider also the soldering guide, see [Section 2.1, "Test equipment"](#), on page 10.

5.2.4.4 Measurements

The differential AC input levels for strobe measurements consist of up to two measurements. It tests the limits as defined in section 8.7.2 (DDR4)/ 7.2.6 (LPDDR4/ LPDDR4X) of the JESD79-4B(DDR4)/ JESD209-4B(LPDDR4) specifications.

Differential input high AC - $V_{IHdiff(Peak)}$

This test aims to verify that the AC differential input high is within the limits defined in the specification.

Differential input low AC - $V_{ILdiff(Peak)}$

This test aims to verify that the AC differential input low is within the limits defined in the specification.

 $V_{IHdiff(AC)}$

Available only for DDR4 test. This test aims to verify that the AC differential voltage at which the receiver detects a high logic level is within the limits defined in the specification.

 $V_{ILdiff(AC)}$

Available only for DDR4 test. This test aims to verify that the AC differential voltage at which the receiver detects a low logic level is within the limits defined in the specification.

5.2.5 AC differential cross point voltage for DQS

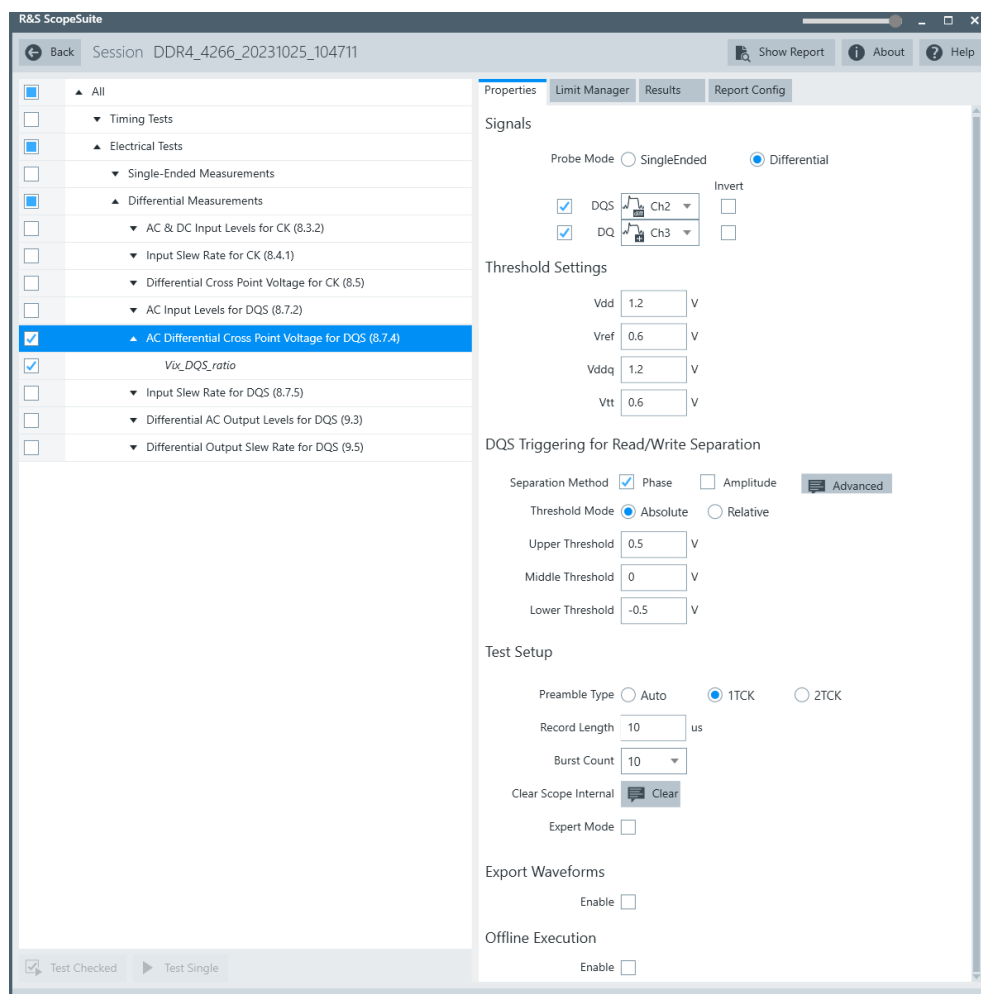

This chapter is only relevant for DDR4 tests.

5.2.5.1 Test equipment

Item	Description, model	Quantity
Rohde & Schwarz oscilloscope	R&S RTP with 4 channels and minimum 8 GHz bandwidth	1
Modular probe	Probe with minimum 9 GHz bandwidth	2
Probe tip	R&S RT-ZMA10 or R&S RT-ZMA14	2
DUT	DDR4 device that supports the selected type	1

5.2.5.2 Performing the tests

1. Start the test as described in [Section 3.5, "Starting DDR4 tests"](#), on page 26.
2. Select "Electrical Tests" > "Differential Signals" > "AC Differential Cross Point Voltage for DQS".

3. Enable the tests that you want to run.
4. Click "Test Single".
5. Follow the instructions of the step-by step guide.
When you have finished all steps, the compliance test runs automatically.
6. You can also run the test in offline mode, using downloaded waveforms. For details, see ["Offline Execution"](#) on page 25.

5.2.5.3 Test setup

The software guides you to make the proper connections. Follow the steps to conduct the test.

The software is intended to facilitate the execution of a set of measurements on the relevant signals.

Consider also the soldering guide, see [Section 2.1, "Test equipment"](#), on page 10.

5.2.5.4 Measurements

The differential cross point voltage for strobe measurement consists of one measurement. It tests the limits as defined in section 8.7.4 of the JESD79-4B(DDR4) specification.

$V_{ix_DQS_ratio}$

This test aims to verify the $V_{ix_DQS_ratio}$ ratio is within the limits defined in the specification.

The $V_{ix_DQS_ratio}$ ratio is defined as the true DQS and complement DQS crossing relative to the midpoint of their signal swings.

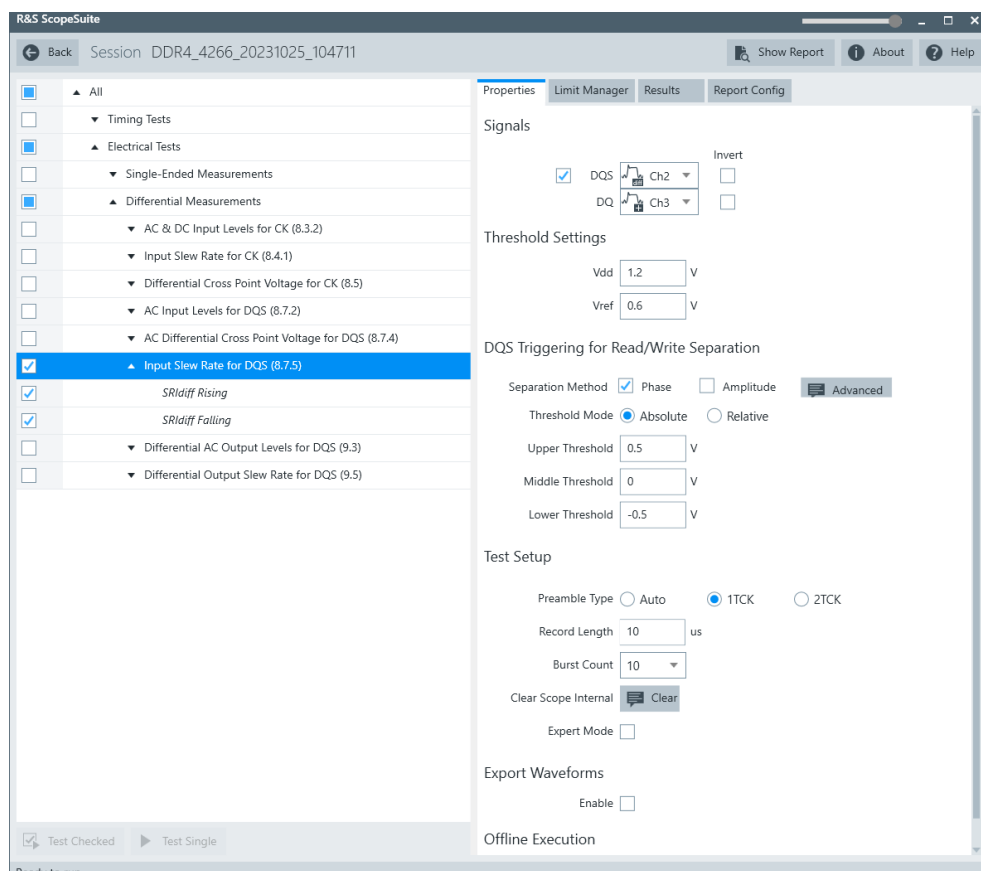

5.2.6 Input slew rate for DQS

5.2.6.1 Test equipment

Item	Description, model	Quantity
Rohde & Schwarz oscilloscope	R&S RTP with 4 channels and minimum 8 GHz bandwidth	1
Modular probe	Probe with minimum 9 GHz bandwidth	2
Probe tip	R&S RT-ZMA10 or R&S RT-ZMA14	2
DUT	DDR4 device that supports the selected type	1

5.2.6.2 Performing the tests

1. Start the test as described in [Section 3.5, "Starting DDR4 tests"](#), on page 26.
2. Select "Electrical Tests" > "Differential Signals" > "Input Slew Rate for DQS".

3. Enable the tests that you want to run.
4. Click "Test Single".
5. Follow the instructions of the step-by step guide.
When you have finished all steps, the compliance test runs automatically.
6. You can also run the test in offline mode, using downloaded waveforms. For details, see ["Offline Execution"](#) on page 25.

5.2.6.3 Test setup

The software guides you to make the proper connections. Follow the steps to conduct the test.

The software is intended to facilitate the execution of a set of measurements on the relevant signals.

Consider also the soldering guide, see [Section 2.1, "Test equipment"](#), on page 10.

5.2.6.4 Measurements

The differential input slew rates for strobe measurements consist of up to two measurements. It tests the limits as defined in sections 8.7.5 (DDR4)/ 7.2.9(LPDDR4/LPDDR4X) of the JESD79-4B(DDR4)/ JESD209-4B(LPDDR4) specifications.

Differential input slew rate rising - SR(diff) rising

This test aims to verify that the setup slew rate for rising signal is within the limits defined in the specification.

Differential input slew rate falling - SR(diff) falling

This test aims to verify that the setup slew rate for falling signal is within the limits defined in the specification.

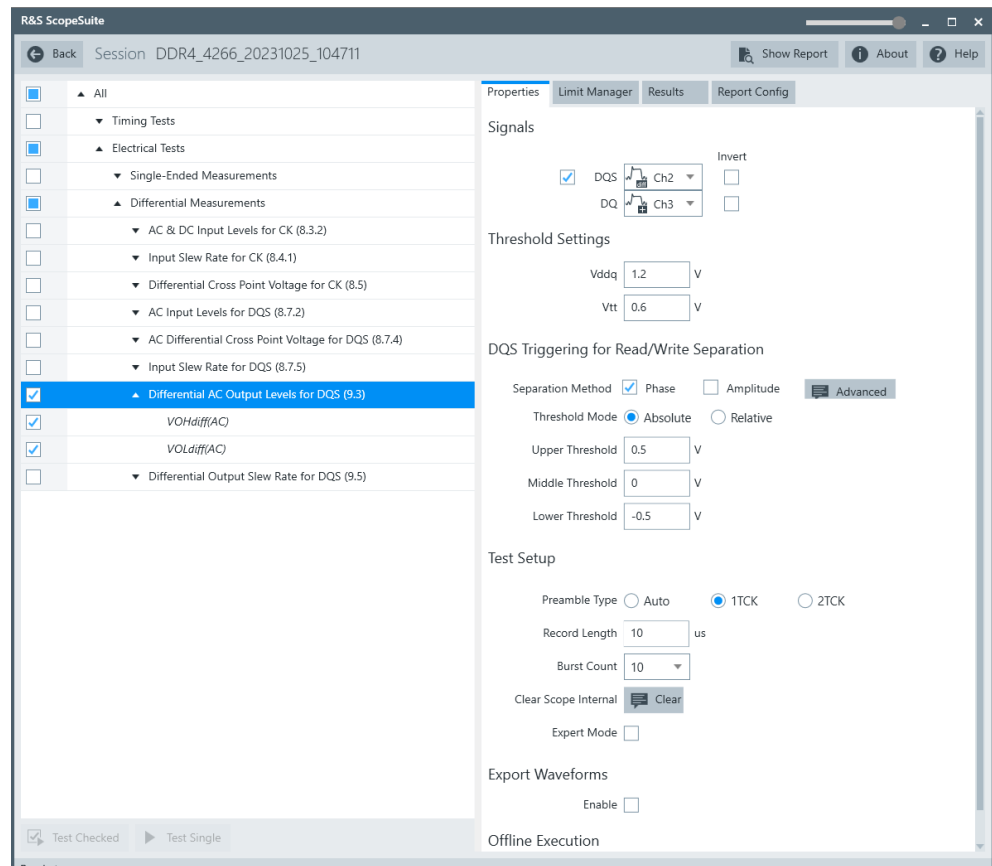

5.2.7 Differential AC output levels for DQS

5.2.7.1 Test equipment

Item	Description, model	Quantity
Rohde & Schwarz oscilloscope	R&S RTP with 4 channels and minimum 8 GHz bandwidth	1
Modular probe	Probe with minimum 9 GHz bandwidth	2
Probe tip	R&S RT-ZMA10 or R&S RT-ZMA14	2
DUT	DDR4 device that supports the selected type	1

5.2.7.2 Performing the tests

1. Start the test as described in [Section 3.5, "Starting DDR4 tests"](#), on page 26.
2. Select "Electrical Tests" > "Differential Signals" > "Differential AC Output Levels for DQS".

3. Enable the tests that you want to run.
4. Click "Test Single".
5. Follow the instructions of the step-by step guide.
When you have finished all steps, the compliance test runs automatically.
6. You can also run the test in offline mode, using downloaded waveforms. For details, see ["Offline Execution"](#) on page 25.

5.2.7.3 Test setup

The software guides you to make the proper connections. Follow the steps to conduct the test.

The software is intended to facilitate the execution of a set of measurements on the relevant signals.

Consider also the soldering guide, see [Section 2.1, "Test equipment"](#), on page 10.

5.2.7.4 Measurements

The differential AC output levels for strobe measurements consist of up to two measurements. It tests the limits as defined in section 9.3 of the JESD79-4B(DDR4) specification.

$V_{OHdiff(AC)}$

This test aims to verify that the AC differential output high measurement level for the output slew rate is within the limits defined in the specification.

$V_{OLdiff(AC)}$

This test aims to verify that the AC differential output low measurement level for the output slew rate is within the limits defined in the specification.

5.2.8 Differential output slew rate for DQS

5.2.8.1 Test equipment

Item	Description, model	Quantity
Rohde & Schwarz oscilloscope	R&S RTP with 4 channels and minimum 8 GHz bandwidth	1
Modular probe	Probe with minimum 9 GHz bandwidth	2
Probe tip	R&S RT-ZMA10 or R&S RT-ZMA14	2
DUT	DDR4 device that supports the selected type	1

5.2.8.2 Performing the tests

1. Start the test as described in [Section 3.5, "Starting DDR4 tests"](#), on page 26.
2. Select "Electrical Tests" > "Differential Signals" > "Differential Output Slew Rate for DQS".

3. Enable the tests that you want to run.
4. Click "Test Single".
5. Follow the instructions of the step-by step guide.
When you have finished all steps, the compliance test runs automatically.
6. You can also run the test in offline mode, using downloaded waveforms. For details, see ["Offline Execution"](#) on page 25.

5.2.8.3 Test setup

The software guides you to make the proper connections. Follow the steps to conduct the test.

The software is intended to facilitate the execution of a set of measurements on the relevant signals.

Consider also the soldering guide, see [Section 2.1, "Test equipment"](#), on page 10.

5.2.8.4 Measurements

The differential output slew rate for strobe consists of up to two measurements. It tests the limits as defined in section 9.5 (DDR4) / 7.2.9 (LPDDR4) / 4.3 (LPDDR4X) of the JESD79-4B(DDR4)/ JESD209-4B(LPDDR4)/JESD209-4-1(LPDDR4X) specifications.

Slew rate query output differential signals rising- SRQdiff rising

This test aims to verify that the differential output slew rate for rising edge is within the limits defined in the specification. It is measured from VOLdiff(AC) to VOHdiff(AC).

Slew rate query output differential signals falling - SRQdiff falling

This test aims to verify that the differential output slew rate for falling edge is within the limits defined in the specification. It is measured from VOHdiff(AC) to VOLdiff(AC).
