

# Fading Simulation

## R&S®SMW-B14/-B15/-K71/-K72/- K73/-K74/-K75/-K820/-K821/-K822/- K823

### User Manual

1175682602  
Version 29

**ROHDE & SCHWARZ**  
Make ideas real

This document describes the following software options:

- R&S®SMW-B14 Fading simulator (1413.1500.02)
- R&S®SMW-B15 Fading simulator and signal processor (1414.4710.xx)
- R&S®SMW-K71 Dynamic fading (1413.3532.xx)
- R&S®SMW-K72 Enhanced models (1413.3584.xx)
- R&S®SMW-K73 MIMO-OTA enhancements (1414.2300.xx)
- R&S®SMW-K74 MIMO-fading/routing (1413.3632.xx)
- R&S®SMW-K75 Higher-order MIMO (1413.9576.xx)
- R&S®SMW-K820 Customized dynamic fading (1414.2581.xx)
- R&S®SMW-K821 MIMO subsets (1414.4403.xx)
- R&S®SMW-K822 Fading BW extension (1414.6712.xx)
- R&S®SMW-K823 Fading BW extension (1414.6735.xx)

This manual describes firmware version FW 5.20.043.xx and later of the R&S®SMW200A.

# 1 Welcome to the fading simulator

The hardware option R&S SMW-B14/B15 in combination with the firmware applications R&S SMW-K71/-K72/-K73/-K74/-K75/-K820/-K821/-K822/-K823 add functionality to simulate fading propagation conditions.

## Key features

The most important features at a glance:

- Simulation of real time fading conditions in SISO and MIMO modes.
- Main characteristics in SISO mode:
  - Maximal bandwidth  $B_{\max}$  = 160 MHz (R&S SMW-B14),  
200 MHz (R&S SMW-B15), 400 MHz (R&S SMW-K822) and  
800 MHz (R&S SMW-K823)
  - Up to 20 fading paths in SISO mode in two independent channels
- Support of versatile MIMO configurations, like 2x2, 2x8 and 4x4 MIMO channels with up to 64 MIMO channels
  - 20 paths per MIMO channel
  - Sampling rate and maximal bandwidth depend on the MIMO mode and the installed option (R&S SMW-B14/-B15/-K822/-K823)
- Simulation of multiple entity MIMO scenarios, like 4x2x2 MIMO or 8xSISO (8x1x1) configurations
- A wide range of presets based on the test specifications of the major mobile radio standards, incl. Rel. 15 and Rel. 16 5G new radio channel models
- Graphical presentation of the defined fading paths

For more information, see data sheet.

This user manual contains a description of the functionality that the application provides, including remote control operation.

All functions not discussed in this manual are the same as in the base unit and are described in the R&S SMW user manual. The latest version is available at:

[www.rohde-schwarz.com/manual/SMW200A](http://www.rohde-schwarz.com/manual/SMW200A)

## Installation

You can find detailed installation instructions in the delivery of the option or in the R&S SMW service manual.

## 1.1 Accessing the fading simulator

### To access and configure the "Fading Simulator" settings

Depending on the installed options:

1. Option: **R&S SMW-B14**
  - a) In the block diagram of the R&S SMW, select "Fading > Fading Settings".
2. Option: **R&S SMW-B15**
  - a) In the block diagram of the R&S SMW, select "I/Q Stream Mapper > Fading/ Baseband Config > Mode = Advanced".
  - b) Select "Signal Outputs = Analog & Digital"
  - c) Confirm with "Apply".
  - d) In the block diagram of the R&S SMW, select "Fading > Fading Settings".

A dialog box opens that display the provided general settings.

The signal generation is not started immediately. To start signal generation with the default settings, select "Fading > State > On".

For information, see:

- [Chapter 2, "About the fading simulator", on page 18](#)
- [Chapter 3, "Fading settings", on page 28](#)
- [Chapter 4, "Signal routing settings", on page 90](#)
- [Chapter 5, "Multiple input multiple output \(MIMO\)", on page 94](#)

## 1.2 What's new

This manual describes firmware version FW 5.20.043.xx and later of the R&S®SMW200A.

Compared to the previous version, it provides the following new features:

- Fading profiles added for 5G NR MIMO scenarios and 5GNR moving propagation scenarios, see "[Standard / Test Case](#)" on page 31:
  - Non-terrestrial network (NTN) TDLA and TDLC fading profiles: "NTN TDLA100-200 Low/Med/High" and "NTN TDLC5-200 Low/Med/High"  
See [Chapter A.23.7, "FR1 NTN TDLA100-200 Low/Med/High", on page 340](#) and [Chapter A.23.8, "FR1 NTN TDLC5-200 Low/Med/High", on page 341](#).
  - 5G NR moving propagation fading profiles: "MP Y 120kHz SCS" and "MP NTN X 15kHz/30kHz SCS"  
See [Chapter A.26.2, "MP Y 15kHz/30kHz/120kHz SCS", on page 346](#) and [Chapter A.26.4, "MP NTN X 15kHz/30kHz SCS", on page 347](#).
- Updated comparison of fading characteristics R&S SMW-B14 and R&S SMW-B15, see [Chapter 2.4, "Characteristics of R&S SMW-B14 and R&S SMW-B15", on page 25](#).

- R&S SMW-K71 High-speed traing Doppler frequencies of up to 190 KHz for pure Doppler fading profile, see [Example "Querying doppler shifts for high-speed train profiles" on page 188](#).

## 1.3 Documentation overview

This section provides an overview of the R&S SMW user documentation. Unless specified otherwise, you find the documents at:

[www.rohde-schwarz.com/manual/smw200a](http://www.rohde-schwarz.com/manual/smw200a)

### 1.3.1 Getting started manual

Introduces the R&S SMW and describes how to set up and start working with the product. Includes basic operations, typical measurement examples, and general information, e.g. safety instructions, etc. A printed version is delivered with the instrument.

### 1.3.2 User manuals and help

Separate manuals for the base unit and the software options are provided for download:

- Base unit manual  
Contains the description of all instrument modes and functions. It also provides an introduction to remote control, a complete description of the remote control commands with programming examples, and information on maintenance, instrument interfaces and error messages. Includes the contents of the getting started manual.
- Software option manual  
Contains the description of the specific functions of an option. Basic information on operating the R&S SMW is not included.

The contents of the user manuals are available as help in the R&S SMW. The help offers quick, context-sensitive access to the complete information for the base unit and the software options.

All user manuals are also available for download or for immediate display on the Internet.

### 1.3.3 Tutorials

The R&S SMW provides interactive examples and demonstrations on operating the instrument in form of tutorials. A set of tutorials is available directly on the instrument.

### 1.3.4 Service manual

Describes the performance test for checking compliance with rated specifications, firmware update, troubleshooting, adjustments, installing options and maintenance.

The service manual is available for registered users on the global Rohde & Schwarz information system (GLORIS):

<https://gloris.rohde-schwarz.com>

### 1.3.5 Instrument security procedures

Deals with security issues when working with the R&S SMW in secure areas. It is available for download on the internet.

### 1.3.6 Printed safety instructions

Provides safety information in many languages. The printed document is delivered with the product.

### 1.3.7 Data sheets and brochures

The data sheet contains the technical specifications of the R&S SMW. It also lists the options and their order numbers and optional accessories.

The brochure provides an overview of the instrument and deals with the specific characteristics.

See [www.rohde-schwarz.com/brochure-datasheet/smw200a](http://www.rohde-schwarz.com/brochure-datasheet/smw200a)

### 1.3.8 Release notes and open source acknowledgment (OSA)

The release notes list new features, improvements and known issues of the current firmware version, and describe the firmware installation.

The software makes use of several valuable open source software packages. An open-source acknowledgment document provides verbatim license texts of the used open source software.

See [www.rohde-schwarz.com/firmware/smw200a](http://www.rohde-schwarz.com/firmware/smw200a)

### 1.3.9 Application notes, application cards, white papers, etc.

These documents deal with special applications or background information on particular topics.

See [www.rohde-schwarz.com/application/smw200a](http://www.rohde-schwarz.com/application/smw200a) and [www.rohde-schwarz.com/manual/smw200a](http://www.rohde-schwarz.com/manual/smw200a)

### 1.3.10 Videos

Find various videos on Rohde & Schwarz products and test and measurement topics on YouTube: <https://www.youtube.com/@RohdeundSchwarz>

On the menu bar, search for your product to find related videos.

Figure 1-1: Product search on YouTube

## 1.4 Scope

Tasks (in manual or remote operation) that are also performed in the base unit in the same way are not described here.

In particular, it includes:

- Managing settings and data lists, like saving and loading settings, creating and accessing data lists, or accessing files in a particular directory.
- Information on regular trigger, marker and clock signals and filter settings, if appropriate.
- General instrument configuration, such as checking the system configuration, configuring networks and remote operation
- Using the common status registers

For a description of such tasks, see the R&S SMW user manual.

## 1.5 Notes on screenshots

When describing the functions of the product, we use sample screenshots. These screenshots are meant to illustrate as many as possible of the provided functions and possible interdependencies between parameters. The shown values may not represent realistic usage scenarios.

The screenshots usually show a fully equipped product, that is: with all options installed. Thus, some functions shown in the screenshots may not be available in your particular product configuration.

## 2 About the fading simulator

Equipped with the required options, the R&S SMW allows you to superimpose real time fading on the baseband signal at the output of the baseband block. In R&S SMW equipped with standard baseband (R&S SMW-B10) and fitted with all the possible fading options, there are up to 20 fading paths in SISO mode available. There are also 20 fading paths per MIMO channel in 4x4 MIMO mode available.

### 2.1 Required options

#### R&S SMW equipped with standard baseband (R&S SMW-B10)

The equipment layout for simulating fading effects in non-MIMO configurations:

- Option baseband generator (R&S SMW-B10) per signal path
- Option baseband main module, one/two I/Q paths to RF (R&S SMW-B13/B13T)
- Option fading simulator (R&S SMW-B14) per signal path  
(sufficient for simulation of fading paths with standard delay and paths with enhanced resolution)
- Additional options that extend the fading functionality:
  - Option dynamic fading (R&S SMW-K71) per signal path  
(required for the simulation of dynamic fading conditions, like birth death propagation, moving propagation, two-channels interferes, high-speed train and customized fading conditions)
  - Option extended statistic functions (R&S SMW-K72) per signal path  
(required for additional fading profiles and some of the predefined test scenarios)
  - Option MIMO-OTA enhancements (R&S SMW-K73) per signal path  
(required for full support of antenna radiation patterns, inverse channel matrix and the geometric-based channel model)
  - Option customized fading (R&S SMW-K820) per signal path  
(required for import of dynamic fading list)

The equipment layout for simulating fading effects in MIMO configurations:

- Two options baseband generator (R&S SMW-B10)
- Option two I/Q paths to RF (R&S SMW-B13T)
- At least two options fading simulator (R&S SMW-B14)
- Option MIMO fading (R&S SMW-K74)  
(required for the configuration of LxMxN MIMO scenarios, with  $L \leq 2$  and up to 16 channels, like 1x2x8 or 1x4x4 scenarios)
- Option higher-order MIMO (R&S SMW-K75)  
(required for the configuration of higher-order LxMxN MIMO scenarios, with  $L \leq 2$  and up to 32 channels like 2x4x4)
- Option multiple entities (R&S SMW-K76)

(required for the configurations with more than two entities, like 8x1x1 scenarios)

The equipment layout for simulating fading effects in higher-order MIMO configurations, like 1x8x8:

- Two options baseband generator (R&S SMW-B10)
- Option two I/Q paths to RF (R&S SMW-B13T)
- Four options fading simulator (R&S SMW-B14)
- Option MIMO fading (R&S SMW-K74)
- Option higher-order MIMO (R&S SMW-K75)
- Option MIMO subsets (R&S SMW-K821)  
(required for the simulation of up to 32 channels (i.e. a subset of the MIMO channels) in a 1x8x8 MIMO scenario)

For more information, see data sheet.

#### R&S SMW equipped with wideband baseband (R&S SMW-B9)

- Option baseband wideband generator (R&S SMW-B9) per signal path
- Option baseband main module (R&S SMW-B13XT)
- Option fading simulator (R&S SMW-B15) per signal path  
(sufficient for simulation of fading paths with standard delay and paths with enhanced resolution)
- Additional options that extend the fading functionality:
  - Option dynamic fading (R&S SMW-K71) per signal path  
(required for the simulation of dynamic fading conditions, like birth death propagation, moving propagation, two-channels interferes, high-speed train and customized fading conditions)
  - Option extended statistic functions (R&S SMW-K72) per signal path  
(required for additional fading profiles and some of the predefined test scenarios)
  - Option MIMO-OTA enhancements (R&S SMW-K73) per signal path  
(required for full support of antenna radiation patterns, inverse channel matrix and the geometric-based channel model)
  - Option-customized fading (R&S SMW-K820) per signal path  
(required for import of dynamic fading list)

The equipment layout for simulating fading effects in MIMO configurations:

- Option baseband wideband generator (R&S SMW-B9) per signal path
- Option baseband main module (R&S SMW-B13XT)
- At least two options fading simulator (R&S SMW-B15)
- Option MIMO fading (R&S SMW-K74)  
(required for the configuration of MIMO scenarios with up to 16 channels, like 1x2x8 or 1x4x4 scenarios)
- Option higher-order MIMO (R&S SMW-K75)  
(required for the configuration of higher-order MIMO scenarios with up to 64 channels)
- Option multiple entities (R&S SMW-K76)

(required for the configurations with more than two entities, like 2x1x1 scenarios)

- Option 400 MHz fading bandwidth (R&S SMW-K822)
- Option 800 MHz fading bandwidth (R&S SMW-K823)

The equipment layout for simulating fading effects in higher-order MIMO configurations, like 1x8x8 or 1x4x4 with one instrument:

- Two options baseband generator (R&S SMW-B9)
- Option baseband main module (R&S SMW-B13XT)
- Four options fading simulator (R&S SMW-B15)
- Option MIMO fading (R&S SMW-K74)
- Option higher-order MIMO (R&S SMW-K75)  
(required for 1x8x8 MIMO configurations with one instrument)
- Option MIMO subsets (R&S SMW-K821)  
(required for simulating of all MIMO channels simulated)
- Option MIMO subsets (R&S SMW-K822)  
(required for the configuration of 1x4x4 MIMO scenarios, all MIMO channels simulated)

For more information, see data sheet.

## 2.2 Overview of the functions provided by the fading simulator

This section summarizes the key functions of the fading simulator to emphasize the way it is suitable for test setups during research, development, and quality assurance involving mobile radio equipment.

### Flexible configuration for support of different test scenarios

You can use the provided fading channels and configure them differently for different test scenarios. Use the same input signal and two separate output signals, for example, to simulate a frequency diversity. Or use separate input signals and sum them after fading, to simulate a network handover, for instance.

See also [Chapter 4, "Signal routing settings"](#), on page 90.

### Predefined fading scenarios

The fading simulator is equipped with a wide range of presets based on the test specifications of the major mobile radio standards. For more complex tests, all the parameters of the supplied fading configurations can be user-defined as required.

See also ["Standard / Test Case"](#) on page 31.

### Repeatable test conditions

To ensure the repeatability of the tests, the fading process is always initiated from a defined starting point.

A restart can be triggered from internal baseband trigger, so that the start of the baseband signal generation and the fading processes are synchronized.

See also [Chapter 3.2, "Restart settings", on page 38](#).

### Graphical presentation

The path graph displays the current defined fading paths and supports you to configure the desired fading channel.

See also [Chapter 3.5, "Path graph", on page 56](#).

### Simulation of diverse fading effects

During transmission of a signal from the transmitter to the receivers, diverse fading effects occur. In the fading simulator, you can simulate these effects separately or in combination.

Using the fading configurations for example, you can define up to 20 fading paths with different delays as they would occur on a transmission channel due to different propagation paths.

See also [Chapter 3.4, "Path table", on page 44](#).

### Predefined fast fading profile for different fading scenarios

The fading simulator provides a wide range of fast fading profiles. You can define the fading conditions per generated fading path. The fast fading profiles simulate fast fluctuations of the signal power level which arise due to variation between constructive and destructive interference during multipath propagation.

See also ["Configuration" on page 31](#) and ["Profile" on page 49](#)

### Simulation of slow fading effect

"Lognormal" and "Suzuki Fading" are slow fading profiles suitable to simulate slow level changes which can occur, due to shadowing effects (for example tunnels, buildings blocks or hills).

See also [Chapter 3.4, "Path table", on page 44](#).

### Simulation of dynamic configurations

Delay variations (whether sudden or slow) do not become important until we reach the fast modulation standards, such as the 3GPP FDD or EUTRA/LTE standards. The delay variations start to play a role if they are on the order of magnitude of the transmitted symbols so that transmission errors can arise.

The provided dynamic configurations simulate dynamic propagation in conformity with test cases defined in the 3GPP and MediaFlo specifications.

See also:

- [Chapter 3.6, "Birth death propagation", on page 57](#)
- [Chapter 3.7, "Moving propagation", on page 63](#)
- [Chapter 3.10, "High-speed train", on page 81](#)

- [Chapter 3.8, "Two channel interferer", on page 71](#)

#### Insertion loss for correct drive at the baseband level

The insertion loss is a method to provide a drive reserve and to keep the output power constant. In the R&S SMW, the used insertion loss is not a fixed value but is dynamically adjusted for different measurement tasks. Thus, you can define the way the range for insertion loss is determined.

See also [Chapter 3.3, "Insertion loss configuration, coupled parameters and global fader coupling", on page 39](#).

#### Support of versatile MIMO configurations

See also [Chapter 5, "Multiple input multiple output \(MIMO\)", on page 94](#).

## 2.3 Definition of commonly used terms

### Fading Simulator

Each option R&S SMW-B14 provides the hardware of one fading simulator, i.e. for each installed fading simulator option, one hardware fader board is available. One, two or four fading simulators can be installed. The provided fading functionality, however, depends on the installed firmware options.

### Fading channel

A fading channel is the term describing the signal between a transmit (Tx) and a receive (Rx) antenna, scattered in various paths.

In a 2x2 MIMO fading configuration, there are four fading channels between the transmit (Tx) and the receive (Rx) antennas. In this description, each fading channel is represented as a block with name following the naming convention " $F_{<Tx><Rx>}$ ", where Tx and Rx are the antennas (e.g. A and B in a 2x2 MIMO configuration).

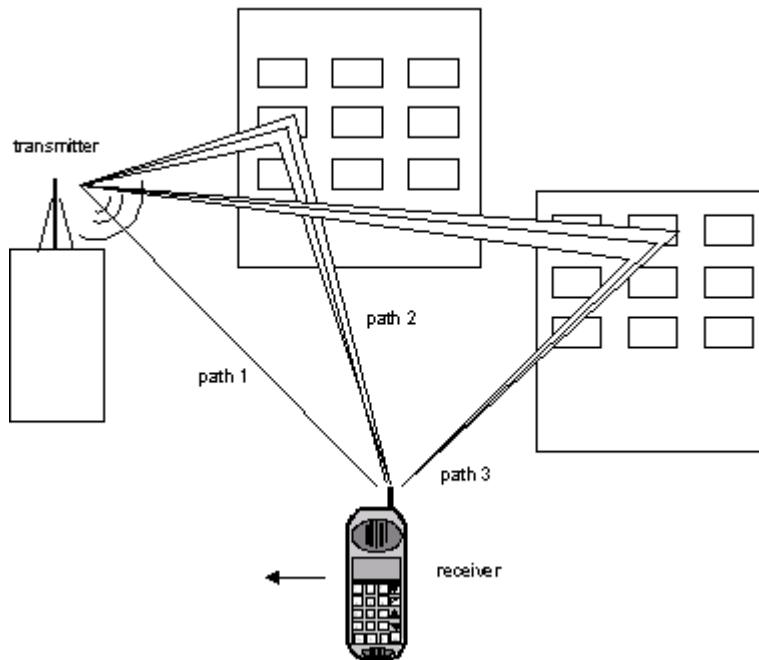

An instrument equipped with the R&S SMW-K74 option simulates up to 16 MIMO fading channels, as it is, for instance required for 4x4 MIMO receiver tests.

If the option R&S SMW-K75 is installed, the number of MIMO channels increases to 32.

### Fading path (tap)

Each fading channel consists of up to 20 fading paths.

The [Figure 2-1](#) illustrates an example of single-channel fading with three transmission paths.

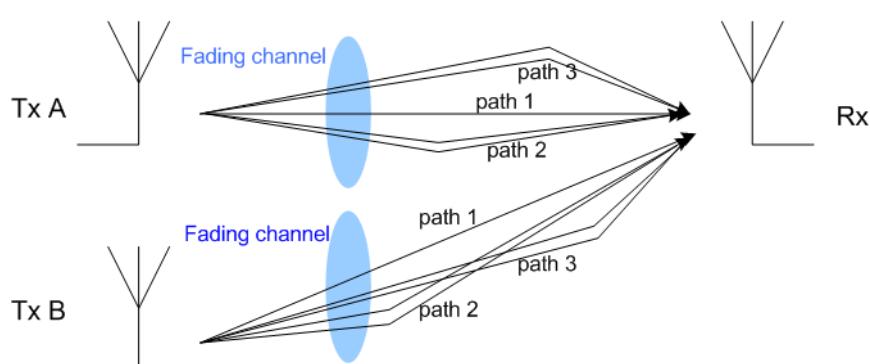

**Figure 2-1: Example of single-channel fading with three transmission paths (SISO configuration)**

Path 1 = Represents the discrete component that is a direct line-of-sight (LOS) transmission between the transmitter and receiver (pure Doppler fading profile)

Paths 2 and 3 = Represent the distributed components that are signals which are scattered due to obstacles (Rayleigh fading profile).

Distributed components, like the paths 2 and 3, consists of several signal echoes and are referred to as "taps".

The [Figure 2-2](#) illustrates an example of two-channel fading with three transmission paths (taps) per channel.

**Figure 2-2: Example of two-channel fading with three transmission paths each**

The R&S SMW supports 20 fading paths per installed fading simulator.

## Path group

In this implementation, a group of paths builds a "path group". In the R&S SMW, the 20 fading paths are divided in 4 path groups. Each group consists of 3 fine and 2 standard delay paths.

A basic delay can be set per path group and an additional delay per path. The total delay per path is the sum of the basic delay of the respective group and of the additional delay of the path.

For more information, see:

- [Chapter 2.4, "Characteristics of R&S SMW-B14 and R&S SMW-B15"](#), on page 25
- ["Basic Delay"](#) on page 51.

## Fading profile

The fading profile determines which transmission path or which radio hop is simulated.

The following is a list of the basic fading profiles implemented in the Fading Simulator.

- **Static Path**

A static path is an unfaded signal that is a signal with constant amplitude and no Doppler shift; though this signal can undergo attenuation (loss) or delay.

- **Constant Phase**

A suitable fading profile to simulate a reflection of an obstacle. Simulated is a transmission signal with constant amplitude and no Doppler shift, but with rotating phase.

- **Pure Doppler**

A fading profile that simulates a direct transmission path on which Doppler shift is occurring due to movement of the receiver.

See Path 1 on the [Figure 2-1](#).

- **Rayleigh**

A suitable fading profile to simulate a radio hop which arises as a result of scatter caused by obstacles in the signal path, like buildings.

See also the conditions of the Paths 2 and 3 on the [Figure 2-1](#).

The resulting received amplitude varies over time. The probability density function for the magnitude of the received amplitude is characterized by a Rayleigh distribution. This fading spectrum is "Classical".

- **Rice**

A fading profile that simulates a Rayleigh radio hop along with a strong direct signal, i.e. applies a combination of distributed and discrete components (see [Figure 2-1](#)).

The probability density of the magnitude of the received amplitude is characterized by a Rice distribution. The fading spectrum of an unmodulated signal involves the superimposition of the classic Doppler spectrum (Rayleigh) with a discrete spectral line (pure Doppler).

The ratio of the power of the two components (Rayleigh and pure Doppler) is configurable, see parameter [Power Ratio](#).

*Example:* The [Figure 2-3](#) shows a baseband signal with QPSK modulation and a rectangular filter which was subjected to Rician fading (one path). As a result of the

luminescence setting on the oscilloscope, the variation in phase and amplitude of the constellation points caused by the fader is clearly visible.

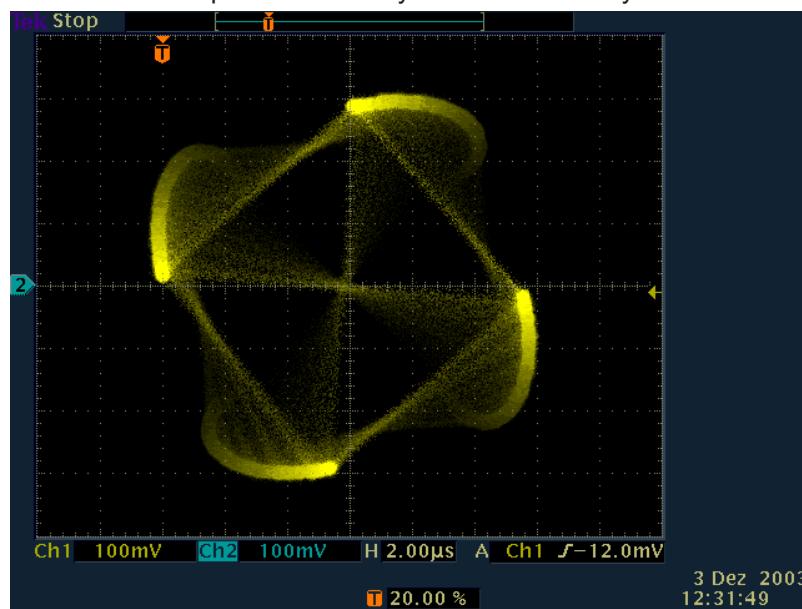

Figure 2-3: Effect of a Rician fading on a baseband signal with QPSK modulation

### MIMO correlation models

The R&S SMW supports the following ways to simulate spatial correlated MIMO channels:

- By description of transmit and receive correlation matrix with direct definition of matrix coefficients or based on the Kronecker assumption
- By definition of clusters at the transmitter and receiver end using channel parameter like angle spread or angle of arrival/departure (AoA/AoD).

See Chapter 5.3, "Fading settings in MIMO configuration", on page 98

## 2.4 Characteristics of R&S SMW-B14 and R&S SMW-B15

The fading simulator includes hardware boards that influence several signal characteristics. This section lists the characteristics that influence the value ranges of major signal parameters.

For details and characteristics on each of the options, see data sheet.

Table 2-1: R&amp;S SMW-B14

Fading channels (depends on LxMxN)	Fading clock rate	Signal band- width	Basic delay range	Basic delay resolution	Additional delay range	Additional delay reso- lution
1 to 8	200 MHz	160 MHz	Group 1: 0 s Group 2 to 4: 0 s to 0.671 s	5 ns	Fine delay path 1: 0 to 40.9 us Fine delay paths 2 to 3: 0 to 20 us Std. delay paths 4 to 5: 0 to 20 us	Fine delay paths 1 to 3: 2.5 ps Std. delay paths 4 to 5: 5 ns
9 to 16	100 MHz	80 MHz		10 ns		Fine delay paths 1 to 3: 5 ps Std. delay paths 4 to 5: 10 ns
17 to 32	50 MHz	40 MHz		20 ns		Fine delay paths 1 to 3: 10 ps Std. delay paths 4 to 5: 20 ns

Table 2-2: R&amp;S SMW-B15, without R&amp;S SMW-K822

Fading channels (depends on LxMxN)	Fading clock rate	Signal band- width	Basic delay range	Basic delay resolution	Additional delay range	Additional delay reso- lution
1 to 8	250 MHz	200 MHz	Group 1: 0 s Group 2 to 4: 0 s to 0.536 s	4 ns	Fine delay path 1: 0 to 32.72 us Fine delay paths 2 to 3: 0 to 16 us Std. delay paths 4 to 5: 0 to 16 us	Fine delay paths 1 to 3: 2 ps Std. delay paths 4 to 5: 4 ns
9 to 16	250 MHz	200 MHz		10 ns		Fine delay paths 1 to 3: 4 ps Std. delay paths 4 to 5: 8 ns
17 to 32	125 MHz	100 MHz		20 ns		Fine delay paths 1 to 3: 8 ps Std. delay paths 4 to 5: 16 ns
33 to 64	62.25 MHz	50 MHz	-	-	-	-

Table 2-3: R&amp;S SMW-B15 and R&amp;S SMW-K822-K823

Fading channels (depends on LxMxN)	Fading clock rate	Signal band- width	Basic delay range	Basic delay resolution	Additional delay range	Additional delay reso- lution
1 to 8 R&S SMW-B15/-K822	500 MHz	400 MHz	Group 1: 0 s Group 2 to 4: 0 s to 0.536 s	4 ns	Std. delay path 1: 0 to 32.72 us Fine delay paths 2 to 3: 0 to 16 us Std. delay paths 4 to 5: 0 to 16 us	Std. delay path 1: 2 ns Std. delay paths 2 to 5: 4 ns
1 to 4 R&S SMW-B15/-K823	1000 MHz	800 MHz				Std. delay path 1: 1 ns Std. delay paths 4 to 5: 8 ns

### Related settings

- LxMxN settings: [Chapter 5.1, "Multiple entity MxN MIMO test configurations", on page 95](#)
- ["Fading Clock Rate" on page 34](#)
- ["Basic Delay" on page 51](#)
- ["Additional Delay" on page 51](#)

The difference in the system clocks and the delay resolutions also affects the used fading paths and the preset values in some of the predefined fading profiles, see [Chapter A, "Predefined fading settings", on page 242](#).

## 2.5 Further signal processing

During further signal routing, you can also offset the faded signals or apply noise to them.

For more information, refer to sections "Adding Noise to the Signal" and "Impairing the Signal" in the R&S SMW User Manual.

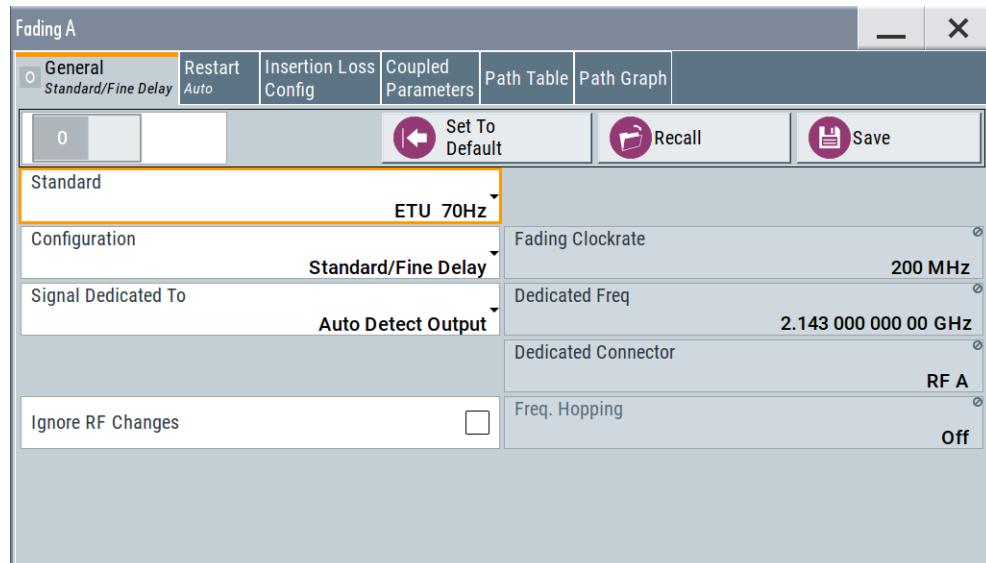

## 3 Fading settings

The "Fading" dialog allows you to configure multipath fading signals. Regardless of the current "System Configuration > Mode", to access this dialog, proceed as follows:

- Select "Block Diagram > Fading > Fading Settings".

The "Fading" dialog opens and displays the general settings.

The dialog is divided into several tabs, logically grouping the available setting.

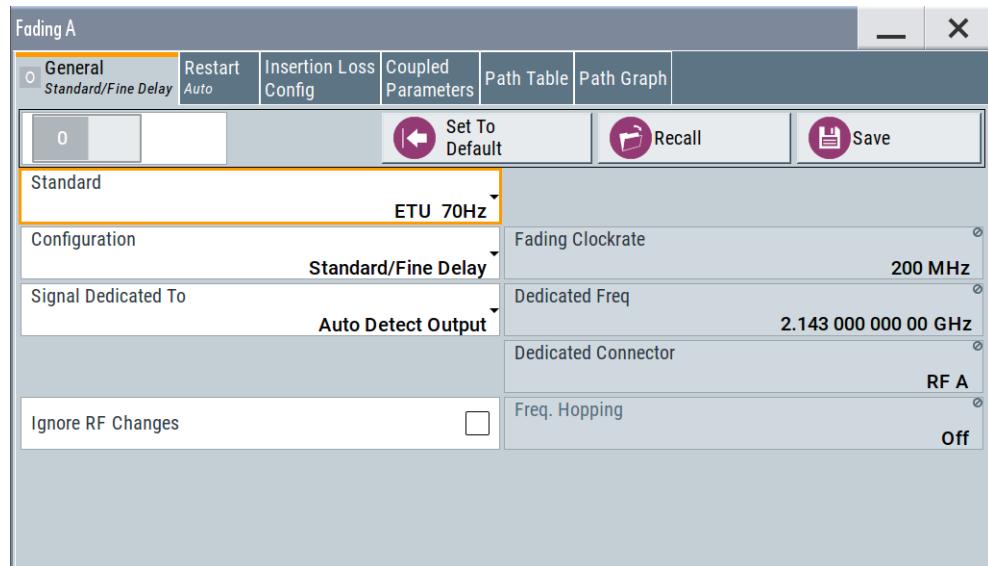

The remote commands required to define these settings are described in [Chapter 6, "Remote-control commands"](#), on page 149.

### Settings:

● General settings.....	29
● Restart settings.....	38
● Insertion loss configuration, coupled parameters and global fader coupling.....	39
● Path table.....	44
● Path graph.....	56
● Birth death propagation.....	57
● Moving propagation.....	63
● Two channel interferer.....	71
● Customized dynamic fading.....	77
● High-speed train.....	81
● Custom fading profile.....	87

## 3.1 General settings

- To access this dialog, select the "Fading > Fading Settings".

Apart from the standard "Set to Default" and "Save/Recall" functions, the dialog provides the settings to:

- In "System Configurations" with more than two entities, the dialog consists of more than one side tabs; one tab per entity. The tab name indicates the fader state the settings are related to.  
See also [Chapter 5.1, "Multiple entity MxN MIMO test configurations"](#), on page 95.
- Select a predefined fading profile according to the common mobile radio standards

### Settings:

<a href="#">State</a>	30
<a href="#">Copy To / Entity</a>	30
<a href="#">Set to Default</a>	30
<a href="#">Save/Recall</a>	31
<a href="#">Standard / Test Case</a>	31
<a href="#">Configuration</a>	31
<a href="#">Moving Channels</a>	34
<a href="#">Fading Clock Rate</a>	34
<a href="#">Signal Dedicated To</a>	34
<a href="#">Dedicated Frequency</a>	37
<a href="#">Dedicated Connector</a>	37
<a href="#">Virtual RF</a>	37
<a href="#">Ignore RF Changes &lt; 5PCT</a>	37
<a href="#">Freq. Hopping</a>	38

**State**

- Option: R&S SMW-B14  
Enables the fading simulator.
- Option: R&S SMW-B15  
Enabled if "System Config > Fading/Baseband Config > Mode = Advanced" is selected and "Apply" executed.

If activated, the fading process is initiated for the enabled paths.

A selectable trigger ("Restart > Mode") can be used to restart the fading process. The fading process always begins at a fixed starting point after each restart. This helps to achieve repeatable test conditions.

Remote command:

`[ :SOURce<hw> ] :FSIMulator [:STATe]` on page 169

**Copy To / Entity**

Option: R&S SMW-K76

In "System Configurations" with multiple entities, copies the settings of the current fading simulator to all or to the selected entities.

See also [Chapter 5.1, "Multiple entity MxN MIMO test configurations", on page 95](#).

Remote command:

`[ :SOURce<hw> ] :FSIMulator:SISO:COPY` on page 152

**Set to Default**

Activates the default settings of the fading simulator.

By default, a path is activated with a Rayleigh profile and a slow speed. All the other paths are switched off.

The following table provides an overview of the settings. The preset value is indicated for each parameter in the description of the remote-control commands.

*Table 3-1: Default values*

Parameter	Value
State	Off
Standard	User
Configuration	Standard Delay
Signal Dedicated to	RF Output
Speed Unit	km/h
Restart Event	Auto
Ignore RF Changes	Off
Frequency Hop. Mode	Off
<b>Insertion Loss</b>	
Insertion Loss Mode	Normal
<b>Coupled Parameters</b>	
All States	Off

Parameter	Value
<b>Path Configuration</b>	
State of path 1	On
State of all other paths	Off
Profile	Rayleigh
Delays	0
Speed of path 1	Slow
Speed of all other paths	0

Remote command:

[\[:SOURce<hw>\]:FSIMulator:PRESet on page 156](#)

### Save/Recall

Accesses the "Save/Recall" dialog, that is the standard instrument function for saving and recalling the complete dialog-related settings in a file. The provided navigation possibilities in the dialog are self-explanatory.

The settings are saved in a file with predefined extension. You can define the filename and the directory, in that you want to save the file.

See also, chapter "File and Data Management" in the R&S SMW user manual.

The R&S SMW stores fading configurations in files with file extension \*.fad.

The dialog displays the name of a currently loaded user settings file. The file name is displayed as long as you do not modify the settings.

Remote command:

[\[:SOURce\]:FSIMulator:CATalog? on page 169](#)

[\[:SOURce<hw>\]:FSIMulator:LOAD on page 170](#)

[\[:SOURce<hw>\]:FSIMulator:STORe on page 170](#)

[\[:SOURce\]:FSIMulator:DELETE on page 170](#)

### Standard / Test Case

Selects predefined fading settings according to the test scenarios defined in the common mobile radio standards.

For an overview of the predefined standards, along with the underlying test scenarios, the enabled settings and the required options, see [Chapter A, "Predefined fading settings", on page 242](#).

If one of the predefined parameters is modified, "User" is displayed. "User" is also the default setting.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:STANDARD on page 161](#)

[\[:SOURce<hw>\]:FSIMulator:STANDARD:REFERENCE on page 168](#)

### Configuration

Selects the fading configuration.

**Note:** The dynamic fading configurations "Birth Death Propagation", and "2 Channel Interferer" are disabled in MIMO configurations.

Depending on which configuration is selected, the further settings the "Fading" dialog change, particularly the path table.

**Note:** A separate path table is associated with each configuration, i.e. each time you select a new configuration, the instrument changes not only the bandwidth but loads a new path table.

Each changing in the configuration interrupts the fading process and restarts the calculation. If the instrument is fitted with more than one fading simulators, they are all affected.

#### "Standard/Fine Delay"

In the R&S SMW, the 20 fading paths are divided in 4 path groups.

Each group consists of 3 fine and 2 standard delay paths. The standard and fine delay configurations differ in terms of the resolution of the path-specific delay, see [Chapter 2.4, "Characteristics of R&S SMW-B14 and R&S SMW-B15"](#), on page 25.

The "Standard/Fine Delay" configuration is sufficient for classical fading with simulation of the level fluctuations. A delay configuration with the provided characteristics occurs in the received signal as a result of a typical multipath propagation and the propagation conditions.

The propagation conditions themselves vary depending on the location and timing.

#### "Birth Death Propagation"

Option: R&S SMW-K71

In the "Birth Death Propagation" configuration, the fading simulator simulates dynamic propagation conditions in conformity with the test case 3GPP, 25.104-320, annex B4. Two paths are simulated which appear ("Birth") or disappear ("Death") in alternation at arbitrary points in time (see [Chapter 3.6, "Birth death propagation"](#), on page 57).

#### "Moving Propagation"

Option: R&S SMW-K71

In the "Moving Propagation" configuration and number of "Moving Channels" set to "One", the fading simulator simulates dynamic propagation conditions in conformity with the test case 3GPP TS25.104, annex B3. Two paths are simulated: Path 1 has fixed delay, while the delay of path 2 varies slowly in a sinusoidal fashion.

Two additional predefined moving propagation scenarios according to the 3GPP TS36.141, annex B.4 can be configured: the "ETU200Hz Moving" and the "Pure Doppler Moving". To configure one of these scenarios for 3GPP or LTE, select the corresponding item under "Standard > 3GPP or LTE > Moving Propagation".

**Note:** The moving propagation conditions enabled by selecting the "Standard > 3GPP or LTE > Moving Propagation > Ref. + Mov. Channels" are identical to the conditions configured by enabling of "Moving Propagation Configuration" and number of "Moving Channels" set to "One".

See [Chapter 3.7, "Moving propagation", on page 63](#) for more information.

#### "2 Channel Interferer"

Option: R&S SMW-K71

In the "2 Channel Interferer" configuration, the fading simulator simulates test case 5 and 6 from MediaFlo.

Two paths are simulated: Path 1 has fixed delay, while the delay of path 2 varies slowly in a sinusoidal fashion or appears or disappears in alternation at arbitrary points in time (hopping).

See [Chapter 3.8, "Two channel interferer", on page 71](#) for more information.

#### "High Speed Train"

Option: R&S SMW-K71

In the High-Speed Train configuration, the fading simulator simulates propagation conditions in conformity with the test case 3GPP 25.141, annex D.4A and 3GPP 36.141, annex B.3.

The instrument simulates all the three scenarios as defined in the test specification. Additionally, user-defined HST conditions can be configured by selecting different profile and setting up the speed and the initial distances.

See [Chapter 3.10, "High-speed train", on page 81](#) for more information.

#### "Customized Dynamic"

Option: R&S SMW-K820

In this configuration, you can load dynamic fading list files that describe the variation of the fading parameters path loss, Doppler shift and delay over time. With suitable fading lists, customized High-Speed Train scenarios can be simulated.

See [Chapter 3.9, "Customized dynamic fading", on page 77](#).

Remote command:

[**:SOURce<hw>]:FSIMulator:CONFiguration** on page 151  
[**:SOURce<hw>]:FSIMulator:BIRTHdeath:STATE** on page 187  
[**:SOURce<hw>]:FSIMulator:MDELay:STATE** on page 197  
[**:SOURce<hw>]:FSIMulator:TCINTERferer[:STATE]** on page 219  
[**:SOURce<hw>]:FSIMulator:HSTRain:STATE** on page 192  
[**:SOURce<hw>]:FSIMulator:CDYNamic:STATE** on page 237

### Moving Channels

Option: R&S SMW-K71

This parameter determines whether only one or several moving channels are simulated.

- |       |  |
|-------|--|
| "One" | In this mode, the fading simulator simulates dynamic propagation conditions in conformity with the test case 3GPP TS25.104, annex B3.                                |
| "All" | Per default, one moving channel with Rayleigh distribution and one tap is simulated.<br>Additional taps and paths can be enabled and configured in the "Path Table". |

Remote command:

[**:SOURce<hw>]:FSIMulator:MDELay:CHANnel:MODE** on page 193

### Fading Clock Rate

Displays the clock rate used by the fading simulator for the signal processing.

The value depends on the selected "System Configuration" and influences the bandwidth of the generated signal.

Remote command:

[**:SOURce<hw>]:FSIMulator:CLOCK:RATE?** on page 153

### Signal Dedicated To

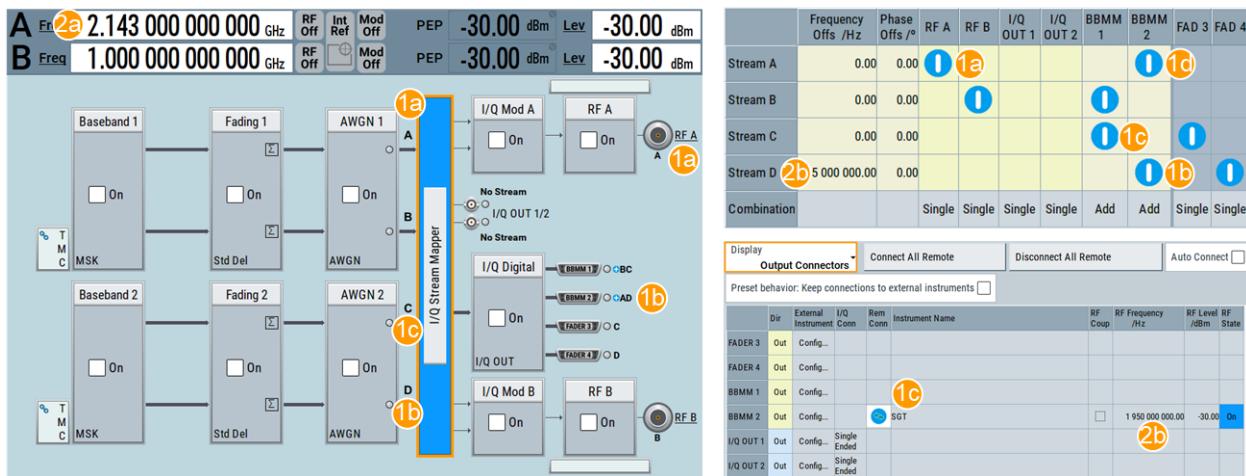

Defines the frequency to that the signal of the whole Fader block is dedicated.

**Example: How the R&S SMW determines the frequency used for the calculation of the Doppler Shift**

This example shows how the R&S SMW determines the fader frequency in "Signal Dedicated To > Auto Detect Output" mode.

- In the "System Configuration > Fading/Baseband Config" dialog, enable a 2x2x2 MIMO configuration with "Baseband Sources > Coupled per Entity".
- In the "I/Q Stream Mapper":
  - route "Stream A/B > RF A/B", "Stream A/D und > BBMM 2" and "Stream B/C > BBMM 1" ("Combination > Add")
  - enable a "Frequency Offset = 5 MHz" for Stream D
- Connect an R&S®SGT100A to the BBMM2 connector of the R&S SMW. In the "External RF and IQ" dialog, configure this connection and set the frequency of the connected instrument, e.g. "RF Frequency = 1.950 GHz".
- In the Status Bar, set "Freq A = 2.143 GHz"

The settings of your instrument should resemble the example on [Figure 3-1](#).

**Figure 3-1: Settings influencing the calculation of the Doppler Shift**

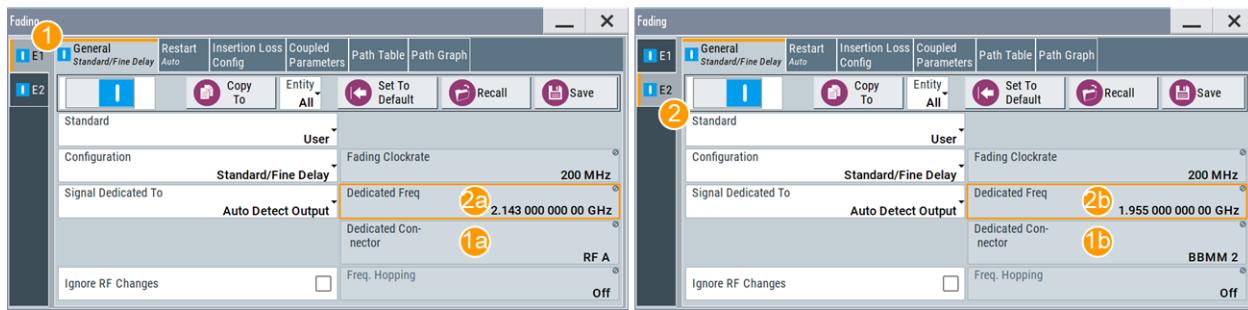

- 1a, 1d = Routing of Stream A ("primary" for "Fading 1")
- 1b = Routing of Stream D ("primary" stream for "Fading 2" but not for "Fading 1")
- 1c = Routing of Stream C; an external device is not connected
- 2a = Frequency RF A, i.e. the frequency of Stream A
- 2b = Parameters influencing the frequency of Stream D

In this configuration, Stream A is the "primary" stream for the "Fading 1"; Stream D is the "primary" for "Fading 2", because of the connected external device.

**Note that:**

- Although Stream C is first stream of "Fading 2" it is not the "primary" one, because there is no external device connected to the BBMM1 or to the FAD3 connector.
- Although an external device is connected to BBMM2, it is not the "primary" for the "Fading 1", because the streams are evaluated "left to right" and "up to down".

Observe the values of the parameter "Dedicated Frequency" for Fader 1 and Fader 2. The settings of your instrument should resemble the example on [Figure 3-2](#).

**Figure 3-2: "Dedicated Frequency" and "Dedicated Connector": understanding the displayed information**

1 = Fader 1

2 = Fader 2

1a = "Dedicated Connector = RF A" because Stream A ("primary") is routed to RF A

1b = "Dedicated Connector = BBMM 2" because Stream D is routed to BBMM 2 and an external instrument is connected to this interface

2a = "Dedicated Frequency = Freq A = 2.143 GHz"

2b = "Dedicated Frequency = RF Frequency<sub>External RF instrument</sub> + Frequency Offset = 1.95 GHz + 5 MHz = 1.955 GHz"

#### "Auto Detect Output"

The Doppler shift is calculated based on the actual RF frequency, that is *dynamically detected* depending on:

- The current signal routing in the "Stream Mapper", in particular the routing and the enabled "Frequency Offset" of the first ("primary") stream of each "Fader"
- **Note:** The RF frequencies and the "Frequency Offset" of all other streams are ignored.
- The external instrument connected to the output interface the "primary" stream is routed to ("System Configuration > External RF and I/Q")
- The "RF Frequency" of the connected instrument ("System Configuration > External RF and I/Q")

The R&S SMW continuously monitors these parameters, calculates the frequency and displays:

- The **Dedicated Frequency**
- The **Dedicated Connector**

A warning message informs you if the detection fails; the "Dedicated Frequency" is set to 1 GHz.

#### "Baseband Output"

Sets the fader frequency *manually*. The Doppler shift is calculated based on a select "Virtual RF" frequency.

If you use an external I/Q modulator to upconvert the generated faded baseband signal, set the value of the parameter **Virtual RF** to the modulation frequency of the external I/Q modulator.

#### Remote command:

[ :SOURce<hw> ] :FSIMulator:SDESTination on page 160

### Dedicated Frequency

In [Signal Dedicated To](#) > "Auto Detect Output" mode, displays the dedicated RF frequency (incl. enabled "Frequency Offset" in the "I/Q Stream Mapper"), used for the calculation of the Doppler Shift.

A warning message informs you if the estimation fails; the "Dedicated Frequency" is set to 1 GHz.

See also:

- [Example"How the R&S SMW determines the frequency used for the calculation of the Doppler Shift" on page 35](#)
- [Dedicated Connector](#).

**Note:** The "Dedicated Frequency" cannot be updated if the RF frequency varies fast, for example if an "RF Frequency Sweep" or a "List Mode" is active and the parameter [Ignore RF Changes < 5PCT](#) is disabled.

For more details, see the data sheet.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:FREQuency](#) on page 153

### Dedicated Connector

In [Signal Dedicated To](#) > "Auto Detect Output" mode, displays the connector used to determine the [Dedicated Frequency](#).

See [Example"How the R&S SMW determines the frequency used for the calculation of the Doppler Shift" on page 35](#).

Remote command:

[\[:SOURce<hw>\]:FSIMulator:FREQuency:DETECT?](#) on page 160

### Virtual RF

In [Signal Dedicated To](#) > "Baseband Output" mode, sets manually the frequency used for the calculation of the Doppler shift.

This parameter is useful if:

- A user-defined Fader frequency is required
- An external I/Q modulator is used to upconvert the generated faded baseband signal.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:FREQuency](#) on page 153

### Ignore RF Changes < 5PCT

This function is password-protected. Unlock the protection level 1 to access it.

Selects whether variation in the RF frequency (also in the frequency of connected external devices) that are smaller than 5% are to be ignored or not for the fading.

"On"              Enables faster frequency hopping because small frequency changes do not result in a short-term switch-off of the fader and a restart of the fading process.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:IGNore:RFChanges](#) on page 154

**Freq. Hopping**

This function is password-protected. Unlock the protection level 1 to access it.

Activates frequency hopping and determines the behavior of the fading simulator after a frequency hop.

In real-world receivers, one of the reasons for frequency hopping could be that due to a change in the location of the receiver, the original carrier is no longer accessible.

In the fading simulator, frequency hopping is implemented by switching of the carrier frequency. The fading simulator is temporarily deactivated until the variation in the RF frequency is completed. The fading process starts then again at the new frequency.

The instrument provides two modes for frequency hopping, that mainly differ in terms of the behavior when hopping back to a prior frequency.

Prior to activating frequency hopping, list mode must be activated in the "List Mode" dialog (State On). The target frequencies of the hops are determined by the frequency values in the selected list. The time until the next frequency hop is determined by the entered "Dwell Time". The HOP signal which marks the time point of the frequency hop can be output on one of the USER connectors. These settings are available only for the delay configurations.

For detailed information, refer to sections "Varying the RF Signal in List or Sweep Mode" and "Local and Global Connectors" in the R&S SMW user manual.

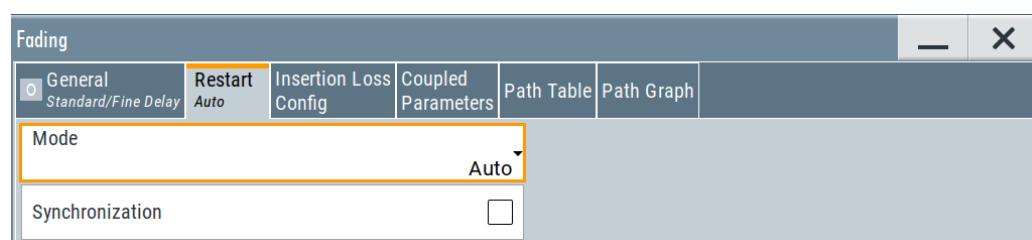

Remote command:

`[ :SOURce<hw> ] :FSIMulator:HOPPing:MODE` on page 154

## 3.2 Restart settings

Access:

- ▶ Select "Fading > Restart".

Mode.....	38
Synchronization.....	39

**Mode**

Selects the event which leads to a restart of the fading.

To achieve repeatable test conditions, after each restart the fading process starts at a fixed starting point. The fading process then passes through identical random processes for a particular setting.

"Auto"              The modulation signal is continually faded.

**"Baseband Trigger"**

In MIMO scenarios, this setting restarts the fading process synchronous with the baseband trigger signal. Thus, the start of the baseband signal generation and the fading processes are synchronized.

This setting is useful in the following situations:

- If repeatability of tests with baseband and fading signal is required.
- For triggering of the fading simulations in multi-instruments set-ups, for example when calculating 8x8 or 4x4 MIMO signals with two R&S SMW.

See R&S SMW User Manual, section "How to Generate a 8x8 MIMO Signal with Two R&S SMW"

**"Armed Auto"** Not supported in the current version.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:REStart:MODE](#) on page 156

**Synchronization**

Couples the fading simulators so that if both blocks are active, a subsequent restart event in any of them causes a simultaneous restart of the other.

Restart event can be caused by a start/stop alternation or a parameter change that results in a signal recalculation and therefore a process restart.

Remote command:

[\[:SOURce\]:FSIMulator:SYNChronize:STATE](#) on page 159

### 3.3 Insertion loss configuration, coupled parameters and global fader coupling

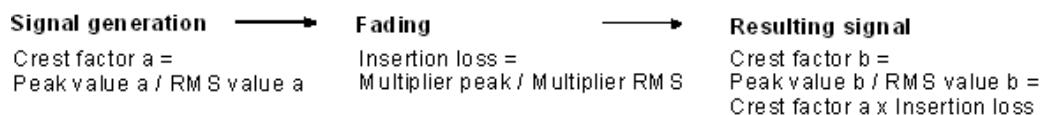

The fading process increases the crest factor of the signal, and this increase must be considered in the drive at the baseband level. Especially when multiple paths are superimposed or if there is statistical influences on a path, an insertion loss is required to provide a drive reserve. If the full drive level is reached nevertheless, the I/Q signals are limited to the maximum available level (clipping).

This section describes the setting, provided to control of the insertion loss and to simplify the operation in dual-channel fading.

#### Impact of the Fading Simulator on the Crest Factor of the Signal

The crest factor is a figure that measures the difference in level between the peak envelope power (PEP) and average power value (RMS) in dB. Hence, either increasing the peak value or decreasing the RMS value results in a higher crest factor. In this implementation, the instrument keeps the peak value as close as possible to the full drive level (multiplier peak > 1) but the fading simulator reduces the RMS value by the additional crest factor due to fading (multiplier RMS). The ratio of these two multipliers is a value, known as the *insertion loss*.

The instrument derives the crest factor of the signal at the output of the fading simulator based on the crest factor of the signal at the input of the "Fading" block and the insertion loss.

### Overview of the provided modes and the main differences between them

In the R&S SMW, the used insertion loss is not a fixed value but is dynamically adjusted for different measurement tasks. For any of the predefined standards/test cases, the instrument selects an optimal range for the insertion loss. In a user-defined fading configuration, you define the way the range for insertion loss is determined.

From the following available modes, select the one most fitting to your application:

- "Normal"

In this mode, the instrument calculates the required insertion loss value in a way, that a full drive is permitted, i.e. the signal is not clipped at the maximum level. The mode results in a high signal quality, but the RMS level is lower than the maximum level. Adjacent channel power (ACP) measurements, however, require a higher dynamic range and a lower insertion loss.

- "Low ACP"

In this mode, the instrument outputs the signal with a higher level relative to the maximum drive, i.e. greater S/N ratio. However, this mode decreases the signal quality because of a higher percentage of clipping.

It is recommended that you enable this mode only for fading paths with Rayleigh profile, as only this profile ensures a statistical distribution of level fluctuation. The other fading profiles are characterized by a non-statistical level fluctuations and a "Low ACP" mode leads to an enormous increase of clipping.

Irrespectively of the selected fading profile, you still can and have to monitor the percentage of clipped samples.

- "User"

This mode relays on a manually defined value. Depending on your particular application, you can find a favorable insertion loss configuration with the desired signal dynamic range and acceptable clipping rate.

Regardless of the selected mode and the path loss settings, the instrument adjust the insertion loss within this range to keep the output power constant. However, the maximum available output power of the R&S SMW is reduced by up to 18 dB.

### Prerequisites for correct insertion loss adaptation

For correct automatic adaptation of the insertion loss, the processes involved in the fading simulation have to be *statistically independent* of each other. This applies to the paths among themselves as well as the paths relative to the input signal. Correct automatic adaptation of the insertion loss is not possible, if statistically correlated processes occur. Examples of statistically correlated processes are the fading of modulation signals with symbol rates approximating the delay differences of the fading paths. A correlation requires, that you measure the level again and manually correct it, e.g. by enabling of a suitable level offset.

The following are two examples explaining the possible reasons for correlation.

**Example: Correlated processes resulting from the used modulation signal and the selected fading configuration**

The instrument is configured to generate a QPSK signal with a symbol rate of 1 Msymb/s is generated and the PRBS 9 sequence as the data source.

Enabled is a fading configuration, consisting of two paths with a Rayleigh profile, identical speed and a resulting delay of 0 us and 1 us, respectively.

The symbol rates of the modulation signal are in the range of the delay differences of the fading paths. The autocorrelation of the modulation data (PRBS 9) to the adjacent symbol is not equal to 0. The fading process is therefore statistically not independent of the process of generating the modulation signal. The automatic calculation of the insertion loss is not correct.

**Example: Correlated processes within the fading simulator**

Enabled is a fading configuration, consisting of two paths with a pure Doppler profile and a resulting Doppler shift of 100 Hz. The start phases of the two paths differ.

This causes super impositions, which in the worst case (e.g. with a phase setting of 0° and 180°) can lead to the deletion of the signal. Automatic calculation of the insertion loss is not possible.

The related settings are summarized in dialog "Fading > Insertion Loss Config/Coupled Parameters > Insertion Loss Configuration", see [Chapter 3.3.1, "Insertion loss configuration settings"](#), on page 41.

### Coupling Fading Parameters

In standard mode ("System Configuration > Mode > Standard"), you can couple a subset of parameters and adjust them jointly. With enabled coupling, the setting of one of the Fading blocks are transferred to the second fading simulator. A subsequent change in the settings of one of the fading simulators results in settings adaptation in the other.

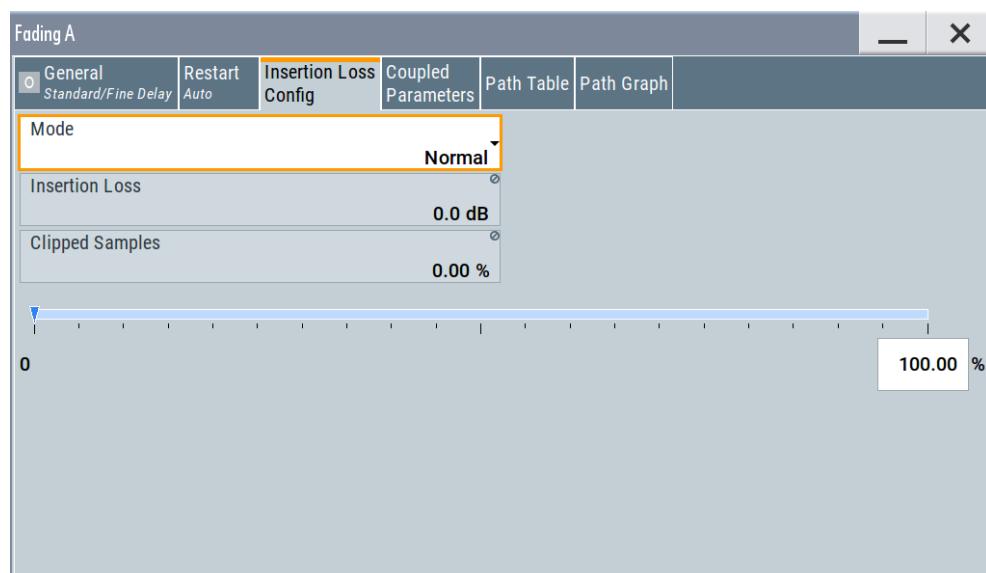

Logically, coupled parameters are available in instruments equipped with more than one Fading Simulator (i.e. more than one R&S SMW-B14 options).

The related settings are grouped in dialog "Fading > Insertion Loss Config/Coupled Parameters > Coupled Parameters", see [Chapter 3.3.2, "Coupled parameters and global fader coupling settings"](#), on page 43.

## 3.3.1 Insertion loss configuration settings

Access:

- ▶ Select "Fading > Insertion Loss Config/Coupled Parameters".

<b>Insertion Loss Mode</b> .....	42
<b>Insertion Loss</b> .....	43
<b>Clipped Samples</b> .....	43
<b>0 ... 100 %</b> .....	43

### Insertion Loss Mode

Sets the mode for determining the insertion loss.

"Mode Normal" The insertion loss for a path of the fading simulator is automatically chosen so that even when lognormal fading is switched on, overdrive occurs only rarely in the fading simulator. This setting is recommended for bit error rate tests (BERTs). The current insertion loss is displayed under "Insertion Loss".

#### "Mode Low ACP"

The insertion loss is automatically chosen so that an overdrive occurs with an acceptable probability. "Low ACP" mode is only recommended for fading paths with Rayleigh profile as only in this case statistical distribution of level fluctuation is ensured. For other fading profiles, non-statistical level fluctuations occur which lead to an enormous increase of clipping. However, monitoring the percentage of clipped samples is recommended for Rayleigh paths also. The current insertion loss is displayed under "Insertion Loss".

#### "Mode User"

Any value for the minimum insertion loss in the range from 0 dB to 18 dB can be selected. Desired value is entered under "Insertion Loss". This mode is provided to ensure optimization of the dynamic range and signal quality for any application. Display of the clipping rate for any value which is entered enables estimation of the signal quality for the specified signal dynamic range.

Remote command:

[**:SOURce<hw>**] :FSIMulator:ILOSS:MODE on page 155

**Insertion Loss**

Displays the current insertion loss in the "Normal" and "Low ACP" modes.

Entry of the insertion loss in "User" mode.

Remote command:

`[ :SOURce<hw> ] :FSIMulator:ILOSS[:LOSS]` on page 155

**Clipped Samples**

Displays the samples whose level is clipped as a %.

If the full drive level is reached for an insertion loss which is too low, the I/Q signals are limited to the maximum available level (clipping).

Remote command:

`[ :SOURce<hw> ] :FSIMulator:ILOSS:CSAMPles?` on page 155

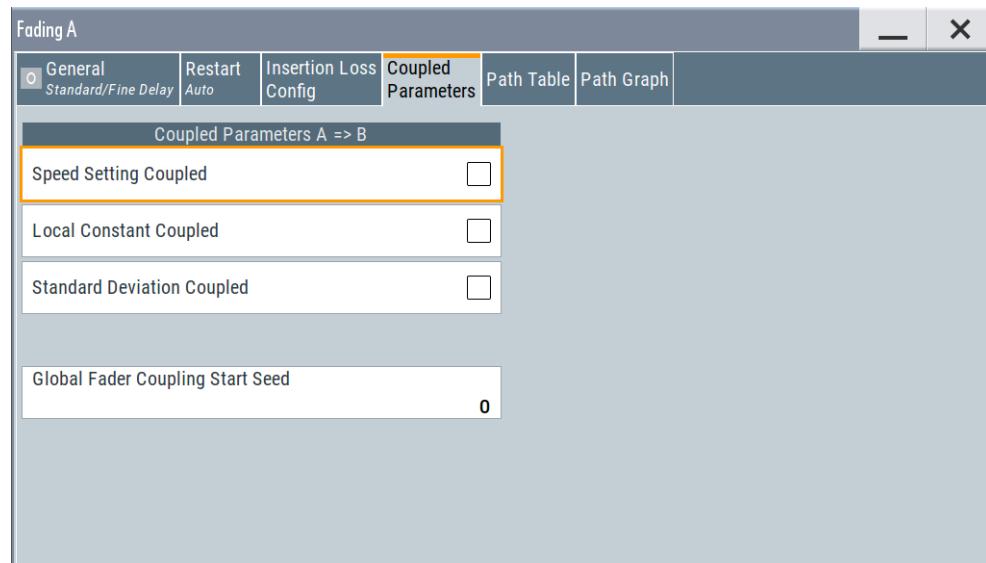

**0 ... 100 %**

Graphically displays the samples whose level is clipped as a %. The scale resolution is determined by entering the maximum value as a %.

### 3.3.2 Coupled parameters and global fader coupling settings

Access:

- ▶ Select "Fading > Insertion Loss Config/Coupled Parameters".

Coupled Parameters.....	44
└ Speed Setting Coupled.....	44
└ Local Constant Coupled.....	44
└ Standard Deviation Coupled.....	44
Start Seed.....	44

**Coupled Parameters**

(available in "System Configuration &gt; Mode &gt; Standard")

**Speed Setting Coupled ← Coupled Parameters**Sets the speed of the paths for both faders. The parameter [Common Speed For All Paths](#) is also coupled.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:COUPle:SPEEd](#) on page 171**Local Constant Coupled ← Coupled Parameters**With lognormal fading, the parameter [Local Constant](#) is coupled for the paths of both faders.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:COUPle:LOGNormal:LCONSTant](#) on page 170**Standard Deviation Coupled ← Coupled Parameters**With lognormal fading, the parameter [Standard Deviation](#) is coupled for the paths of both faders.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:COUPle:LOGNormal:CSTD](#) on page 170**Start Seed**

Enters the start seed for random processes inside the fading simulator. This value is global for the instrument but each fading path uses a different start seed. The autocorrelation of different seeds is more than seven days apart. If two instruments run with the same seed, fading processes will be identical after a retrigger of the fading simulator.

While working in MIMO mode that requires two instruments, set the start seeds of the instruments to different values.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:GLOBal:SEED](#) on page 154

## 3.4 Path table

Access:

1. Select "Fading > Fading Settings > Path Table".

The path table provides the individual path and group parameters.

**Figure 3-3: Fading Path Table: Understanding the displayed information**

1a/1b = Path group number (displayed in the first row) and path number (second row in the table header). The example shows 4 groups with different number of active paths (the first group is marked with a blue border).

2 = Fading profile, assigned per fading path

3/3a = Common group delay of a path group ("Basic Delay" is always 0 for group 1); adjustable for the other groups (light grey background)

4 = Resulting delay per path, calculated as the sum of the common group delay and the path-specific delay

= Adjustable parameter for paths with Rice, WM Rice or Gauss Doppler fading  
= Adjustable parameter for paths with Pure Doppler and constant Phase fading

7 = For moving receivers, selected speed  $v$  or calculated as a function of the resulting Doppler shift  
 $f_D$

= Set resulting Doppler shift  $f_D$  or calculated as  $f_D = f_{RF} \cdot v/c$ , where  $f_{RF}$  is the selected RF and  $c$  the speed of light

= Frequency ratio  $\cos\phi$  is ratio of the actual Doppler shift  $f_A$  and the resulting Doppler shift  $f_D$   
 Actual Doppler shift  $f_A$  calculated as  $f_A = f_0 + \Delta f_{\text{Dop}}$

10 = Actual Doppler shift  $f_A$  calculated as  $f_A = f_D \cdot \cos\phi$   
 11 Pure diastole parameters are on a dark blue column

= Pure display parameters are on a dark background  
= Access to a "IV" (actor) or a "MIMO-Matrix" for configuration

11 = Access to a "Vector" or a "MIMO Matrix" for config  
nols

heis

2. To display all five paths per each group, change the settings as follows:
    - a) Select "Table Settings".

- b) In the "Path Table Settings" dialog, select "Path Filter > All Paths".

#### Cross-reference between the fading parameters

Consider the following interdependencies:

- Delay parameters  
[Resulting Delay](#) = Basic Delay + Additional Delay
- Parameters influencing the Doppler shift calculation:  
[Resulting Doppler Shift](#)  $f_D$  calculated as:

$f_D = (v/c)*f_{RF}$ , where:

- $v$  is the [Speed](#) of the moving receiver
- $f_{RF}$  is the frequency of the RF output signal or the [Virtual RF](#)
- $c=2.998*10^8\text{m/s}$  is the speed of light

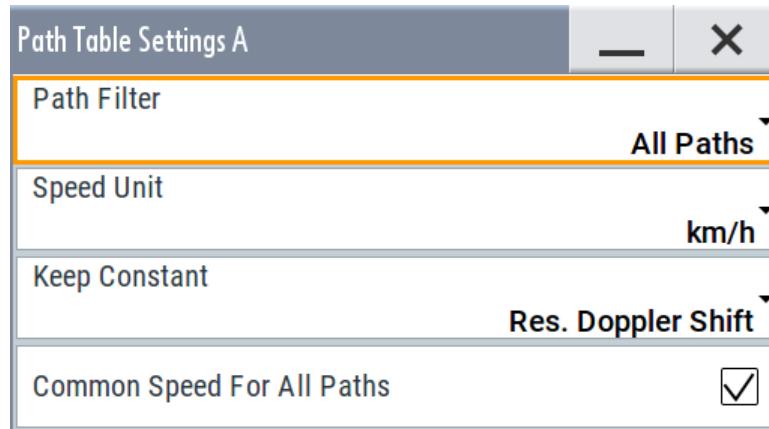

For "Fading Profile > Pure Doppler, Gauss Doppler or Rice", the [Actual Doppler Shift](#)  $f_A$  calculated as:

$f_A = f_D * \cos\varphi t$ , where:

- $\cos\varphi t$  is the [Frequency Ratio](#) and  $\varphi$  is the angle of incidence
- $f_D$  is the [Resulting Doppler Shift](#)

#### 3.4.1 Table settings

- To access this dialog, select "Fading > Fading Settings > Path Table > Table Settings".

The provided functions facilitate settings configuration and navigation in the path table, like suppression of the indication of disabled paths, quick change of the speed unit.

Path Filter.....	47
Speed Unit.....	47
Keep Constant.....	47
Common Speed For All Paths.....	47

**Path Filter**

Suppresses the indication of the disabled paths.

Remote command:

n.a.

**Speed Unit**

Toggles between the available units for speed. The value always remains unchanged but the display is automatically adapted to the selected unit.

**Note:** The remote control command changes only the units displayed in the graphical user interface. While configuring the speed via remote control, the speed units must be specified.

Remote command:

[[:SOURce<hw>](#)] :FSIMulator:SPEED:UNIT on page 161

**Keep Constant**

Selects whether to keep the speed or the resulting Doppler shift constant in case of frequency changes. If a constant speed is selected, the Doppler shift is calculated as function of the speed and the frequency and vice versa.

Remote command:

[[:SOURce<hw>](#)] :FSIMulator:KCONSTANT on page 156

**Common Speed For All Paths**

In delay configurations, activates/deactivates the same speed in all paths.

If [Speed Setting Coupled](#) is enabled, this parameter is also coupled in both faders.

"On" In this default state, a change of speed in a path automatically results in a change of speed in all of the other paths.

"Off" When switching from "Off" to "On", the speed entry for path 1 of group 1 is used for all of the paths.

Remote command:

[[:SOURce<hw>](#)] :FSIMULATOR:CSPEED on page 171

### 3.4.2 Copy path group settings

The provided "Copy Path Group" settings enable you to copy the settings of one to a second fading group.

<a href="#">Copy Path Group</a> .....	47
<a href="#">To</a> .....	48
<a href="#">Copy</a> .....	48

**Copy Path Group**

Selects a group whose settings are to be copied.

Remote command:

[[:SOURce<hw>](#)] :FSIMULATOR:COPY:SOURce on page 152

**To**

Selects a group whose setting is to be overwritten.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:COPY:DESTination on page 152](#)

**Copy**

Triggers a copy procedure.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:COPY:EXECute on page 152](#)

### 3.4.3 Path table settings

State Path.....	48
Profile.....	49
Path Loss.....	50
Basic Delay.....	51

**State Path**

Activates a fading path.

After activating, the fading process is initiated for this path with the selected fading profile. However, the fading simulator must be switched on.

Remote command:

[\[:SOURce<hw>\]:FSIMulator\[:STATe\] on page 169](#)

[\[:SOURce<hw>\]:FSIMulator:DELay|DEL:GROup<st>:PATH<ch>:STATe on page 182](#)

[\[:SOURce<hw>\]:FSIMulator:MDELay:DEL30:GROup<st>:PATH<ch>:STATe on page 182](#)

[\[:SOURce<hw>\]:FSIMulator:HSTRain:PATH:STATe on page 190](#)

**Profile**

Determines the fading profile for the selected path. The fading profile determines which transmission path or which radio hop is simulated.

See also "[Fading profile](#)" on page 24.

Depending on which profile is selected, certain parameters are available in the path table and others are not available.

With correlated paths, the profile setting must agree. When correlation is activated, the setting of the path for which correlation is switched on is accepted for both paths. Afterwards, the most recent modification applies to both paths (no matter in which path it was made).

**"Static Path"** Simulated is a static transmission path which can undergo attenuation (loss) or delay.

**"Pure Doppler"** Simulated is a transmission path with an individual direct connection from the transmitter to the moving receiver (discrete component). The actual Doppler shift is determined by the [Speed](#) and [Frequency Ratio](#) parameters.

**Tip:** In MIMO configuration, use the [Relative gain vector matrix settings](#) to configure beamforming.

**"Rayleigh"** Simulated is a radio hop in which many highly scattered subwaves arrive at a moving receiver.

**"Rice"** Simulated is a radio hop in which a strong direct wave (discrete component) arrives at a moving receiver in addition to many highly scattered subwaves. Use the parameter [Power Ratio](#) to set the ratio of the power of the two components (Rayleigh and pure Doppler).

**"Const. Phase"** Simulated is one transmission path with the set constant phase rotation, attenuation (loss) or delay.

**"Gauss1"** Option: R&S SMW-K72

Sum of two Gaussian functions and is used for excess delay times in the following range:

0.5 µs to 2 µs, ( $0.5 \mu s < \tau_l < 2 \mu s$ ).

$$S(\tau_l, f) = G(A, -0.8f_d, 0.05f_d) + G(A_1, +0.4f_d, 0.1f_d)$$

where  $A_1$  is 10 dB below  $A$ .

**"Gauss2"** Option: R&S SMW-K72

Sum of two Gaussian functions and is used for paths with delays in excess of 2 µs, ( $\tau_l > 2 \mu s$ ).

$$S(\tau_l, f) = G(B, +0.7f_d, 0.1f_d) + G(B_1, -0.4f_d, 0.15f_d)$$

where  $B_1$  is 15 dB below  $B$ .

**"Gauss DAB"** Option: R&S SMW-K72

Composed of a Gaussian function and is used for special DAB profiles.

$$S(\tau_l, f) = G(A, \pm 0.7f_d, 0.1f_d)$$

where  $+ 0.7f_d$  applies for even path numbers and  $0.7f_d$  for odd, except path 1.

"Gauss Doppler"

Option: R&S SMW-K72

Sum of a Gaussian function and a pure Doppler component.

$$S(\tau_l, f) = G(0.1A; 0; 0.08f_d) + \delta(f - 0.5f_d)$$

"Gauss (0.08 fd)"

Option: R&S SMW-K72

Composed of a Gaussian function with a standard deviation of  
0.08\*f<sub>d</sub>.

$$S(\tau_l, f) = G(A; f; 0.08f_d)$$

"Gauss (0.1 fd)"

Option: R&S SMW-K72

Composed of a Gaussian function with a standard deviation of 0.1\*f<sub>d</sub>.

$$S(\tau_l, f) = G(A; f; 0.1f_d)$$

"Gauss (Watters)"

Option: R&S SMW-K72

Gauss (Watterson) fading profile.

"WM Doppler"

Option: R&S SMW-K72

The WiMAX Doppler fading profile is a rounded Doppler PSD model according to IEEE 802.16a.

"WM Rice"

Option: R&S SMW-K72

The WiMAX Rice fading profile is according to IEEE 802.16a.

"Bell Shape tgn Indoor/Bell Shape tgn Moving Vehicle"

Both Bell Shape fading profiles describe the indoor wireless channels according to IEEE 802.11n and IEEE 802.11ac.

The profiles are called after the resulting Doppler power spectrum that has a shape very similar to a "Bell". The second fading profile includes a Doppler component that represents a reflection from a moving vehicle.

"SCM"

Option: R&S SMW-K73

The SCM profile is a geometry-based channel model that improves the accuracy of the simulated channel model.

To access the settings, select "SCM Profile > SCM Data", see [Chapter 5.3.7, "SCM fading profile", on page 116](#)

"Custom"

Option: R&S SMW-K72

Customized Doppler fading profile developed by Cohda-Wireless; the profile describes the channels for testing of IEEE 802.11p signals.

To access the required settings, select "Custom", see [Chapter 3.11, "Custom fading profile", on page 87](#).

Remote command:

`[ :SOURce<hw> ] :FSIMulator:DELay|DEL:GROUP<st>:PATH<ch>:PROFile`  
on page 181

`[ :SOURce<hw> ] :FSIMulator:MDELay:DEL30:GROup<st>:PATH<ch>:PROFile`  
on page 181

### Path Loss

Enters the loss for the selected path.

Remote command:

```
[ :SOURce<hw> ] :FSIMulator:DElay|DEL:GROUP<st>:PATH<ch>:LOSS  
on page 180
```

### Basic Delay

Option: R&S SMW-B14

Sets the basic delay.

Within a path group, all of the paths are jointly delayed by this value.

The path delay is calculated as:

**Resulting Delay = Basic Delay + Additional Delay**

The "Basic Delay" for group 1 is always 0. Thus, for the paths in group 1, the "Resulting Delay" is equal to the "Additional Delay".

See also [Chapter 2.4, "Characteristics of R&S SMW-B14 and R&S SMW-B15"](#),  
on page 25.

Remote command:

```
[ :SOURce<hw> ] :FSIMulator:DElay|DEL:GROUP<st>:PATH<ch>:BDELAY  
on page 173
```

### Additional Delay

Sets the Additional Delay per path.

Remote command:

```
[ :SOURce<hw> ] :FSIMulator:DElay|DEL:GROUP<st>:PATH<ch>:ADELAY  
on page 172
```

### Resulting Delay

Displays the Resulting Delay for the path.

Remote command:

```
[ :SOURce<hw> ] :FSIMulator:DElay|DEL:GROUP<st>:PATH<ch>:RDELAY?  
on page 173
```

### Power Ratio

("Fading Profile > Rice, WM Rice, Gauss Doppler")

Enters the power ratio of the discrete component and distributed component.

The total power consisting of the two components is always constant. At a high power ratio, the discrete (Doppler) component prevails. At a low power ratio, the distributed (Rayleigh) component prevails.

Remote command:

```
[ :SOURce<hw> ] :FSIMulator:DElay|DEL:GROUP<st>:PATH<ch>:PRATIO  
on page 180
```

### Frequency Spread

("Fading Profile > Gauss Watterson")

Sets the frequency spread for the Gauss Watterson fading.

Remote command:

[**:SOURce<hw>**] [**:FSIMulator:DELay|DEL:GROUP<st>:PATH<ch>:FSPRead**  
on page 179

### Frequency Shift

("Fading Profile > Gauss Watterson")

Enters the frequency shift for the Gauss Watterson fading.

Remote command:

[**:SOURce<hw>**] [**:FSIMulator:DELay|DEL:GROUP<st>:PATH<ch>:FSHift**  
on page 178

### Const. Phase

Enters the phase by which the path is multiplied.

Remote command:

[**:SOURce<hw>**] [**:FSIMulator:DELay|DEL:GROUP<st>:PATH<ch>:CPHase**  
on page 175

### Start Phase

("Fading Profile > Pure Doppler, WM Doppler")

A transmission path with the set start phase rotation is simulated which can undergo attenuation (loss) or delay.

Remote command:

[**:SOURce<hw>**] [**:FSIMulator:DELay|DEL:GROUP<st>:PATH<ch>:CPHase**  
on page 175

### Speed

Enters the speed  $v$  of the moving receiver.

The Resulting Doppler Shift  $f_D$  is calculated as:

$$f_D = (v/c) * f_{RF}, \text{ where}$$

$f_{RF}$  is the frequency of the RF output signal or the virtual RF frequency and  $c=2.998*10^8\text{m/s}$  is the speed of light

### Example:

If  $v = 100 \text{ km/h}$  and  $f_{RF} = 1 \text{ GHz}$ , the  $f_D = 92.66 \text{ Hz}$

Consider the following interdependencies:

- If the speed is changed, the resulting Doppler shift is automatically modified.
- If "Path Table Settings > Common Speed in All Paths > On", a change of speed in one path automatically results in a change of speed in all of the other paths of the fader.
- In the "Fading Profile > Pure Doppler/Rice/Gauss Doppler", the actual Doppler Shift  $f_A$  is a function of the selected speed  $v$  and also of the parameter **Frequency Ratio**.  
See also "[Cross-reference between the fading parameters](#)" on page 46
- In "System Configuration > Mode > Standard", you can couple the speed for the paths of both faders.

- With correlated paths, the speed setting must agree. When correlation is activated, the settings of the path for which correlation is switched on are accepted for both paths. Afterwards, the most recent modification applies to both paths (no matter in which path it was made). The same applies to all paths of the two faders when coupling is activated.

Remote command:

[**:SOURce<hw>]:FSIMulator:DElay|DEL:GROup<st>:PATH<ch>:SPEed**  
on page 182

### Resulting Doppler Shift

If "Table Settings > Keep Constant > Speed", this parameter displays the resulting Doppler shift  $f_D$ .

The value depends on the selected:

- [Speed](#)
- RF frequency  $f_{RF}$  or the [Virtual RF](#)
- For "Fading Profile > Pure, Gauss Doppler or Rice", the "Actual Doppler Shift" depends also on the selected [Frequency Ratio](#).

See "[Cross-reference between the fading parameters](#)" on page 46.

To set the Doppler shift, enable "Table Settings > Keep Constant > Resulting Doppler Shift". In this case, the "Speed" is calculated as a function of the selected "Resulting Doppler Shift" and the RF frequency  $f_{RF}$ .

Remote command:

[**:SOURce<hw>]:FSIMulator:DElay|DEL:GROup<st>:PATH<ch>:FDOPpler[:RESulting]**  
on page 176

### Frequency Ratio

("Fading Profile > Pure, Gauss Doppler or Rice")

Sets the ratio of the actual Doppler Shift  $f_A$  to the Resulting Doppler Shift  $f_D$ .

The actual Doppler shift is a function of the simulated angle of incidence of the discrete component (see [Figure 3-4](#)) and is calculated as:

$f_A = f_D * \cos\theta$ , where:

$\cos\theta$  is the "Frequency Ratio" and  $f_D = (v/c) * f_{RF}$  is the [Resulting Doppler Shift](#).

Negative values indicate a receiver that is going away from the transmitter, and positive values a receiver that is approaching the transmitter.

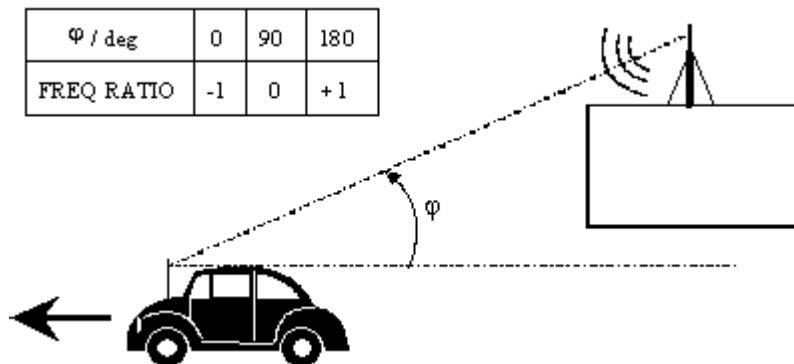

Figure 3-4: Doppler shift as a function of the angle of incidence

See also "[Cross-reference between the fading parameters](#)" on page 46

With correlated paths, the speed setting of the Frequency Ratio must agree. When correlation is activated, the settings of the path for which correlation is switched on are accepted for both paths. Afterwards, the most recent modification applies to both paths (no matter in which path it was made).

Remote command:

```
[:SOURce<hw>] :FSIMulator:DELay|DEL:GROUP<st>:PATH<ch>:FRATio  
on page 178
```

### Actual Doppler Shift

("[Fading Profile > Pure Doppler, Gauss Doppler, Rice](#)")

Displays the actual Doppler shift  $f_A$ . The value depends on [Frequency Ratio](#) and [Resulting Doppler Shift](#).

See also "[Cross-reference between the fading parameters](#)" on page 46.

Remote command:

```
[:SOURce<hw>] :FSIMulator:DELay|DEL:GROUP<st>:PATH<ch>:FDOPpler:  
ACTual? on page 177
```

### Correlation Path

Switches on correlation to the corresponding path of the second fader for dual-channel fading.

Setting correlation necessitates synchronous signal processing on both channels. This means the settings of the following parameters for the correlated fading paths must agree:

- "Profile"
- "Speed"
- "Frequency Ratio"
- "Lognormal Parameters"
- "Resulting Doppler Shift"
- "Actual Doppler Shift"

When correlation is activated, the settings of the path for which correlation is switched on are accepted for both paths. Afterwards, the most recent modification applies to both paths (no matter in which path it was made).

Correlated paths in dual-channel fading with the same input signal simulate the receiving conditions experienced by a receiver having two antennas in which the received signals exhibit a certain degree of correlation due to a similar environment.

Remote command:

```
[ :SOURce<hw> ] :FSIMulator:DElay|DEL:GROup<st>:PATH<ch>:  
CORRelatiOn:STATE on page 175
```

#### **Correlation Coefficient**

Sets the magnitude of the complex correlation coefficient as a percentage.

The higher the entered percentage, the greater the correlation of the statistical fading processes for the two correlated paths. Highly correlated ambient conditions for the signal are simulated in this manner.

Each fader has a maximum of 20 paths.

With correlated paths, the coefficient setting must agree. When correlation is activated, the setting of the path for which correlation is switched on is accepted for both paths. Afterwards, the most recent modification applies to both paths (no matter in which path it was made).

Remote command:

```
[ :SOURce<hw> ] :FSIMulator:DElay|DEL:GROup<st>:PATH<ch>:  
CORRelatiOn:COEFFicient on page 174
```

#### **Correlation Coefficient Phase**

Sets the phase of the complex correlation coefficient in degrees.

With correlated paths, the coefficient phase setting must agree. When correlation is activated, the setting of the path for which correlation is switched on is accepted for both paths. Afterwards, the most recent modification applies to both paths (no matter in which path it was made).

Remote command:

```
[ :SOURce<hw> ] :FSIMulator:DElay|DEL:GROup<st>:PATH<ch>:  
CORRelatiOn:PHASe on page 175
```

#### **Lognormal State**

Switches lognormal fading on/off (slow fading).

Simulated is an additional slow fluctuation of the received amplitude of a moving receiver. This can occur due to peculiarities in the landscape or topography (e.g. when driving through a depression). Lognormal fading has a multiplicative effect on the path loss. The multiplication factor is time-variable and logarithmically normally distributed. If a Rayleigh profile is set simultaneously, what we obtain is Suzuki fading.

**Note:** Since the slow level fluctuation is not taken into account statistically in the computation of the insertion loss, the output power can deviate from the displayed power.

Remote command:

```
[ :SOURce<hw> ] :FSIMulator:DElay|DEL:GROup<st>:PATH<ch>:LOGNormal:  
STATE on page 180
```

#### **Local Constant**

Enters the Local Constant for lognormal fading.

The Local Constant L and the speed v of the moving receiver determine the limit frequency  $f_L$  for lognormal fading:

$$f_L = v/L.$$

The power density spectrum of an unmodulated carrier consists of a discrete spectral line at  $f_{RF}$  and a frequency-dependent continuous component for which the following applies:

$$S(f) = \text{const} * e^{-0.5 * \left( \frac{f - f_{RF}}{f_L} \right)}$$

The lower setting limit is a function of the (virtual) RF frequency  $f_{RF}$  and is calculated as follows:

$$L_{\min} = 12 * 10^9 / f_{RF}$$

Remote command:

`[ :SOURce<hw>] :FSIMulator:DELay|DEL:GROup<st>:PATH<ch>:LOGNormal:LCONSTant` on page 179

#### Standard Deviation

Enters the standard deviation in dB for lognormal fading.

Remote command:

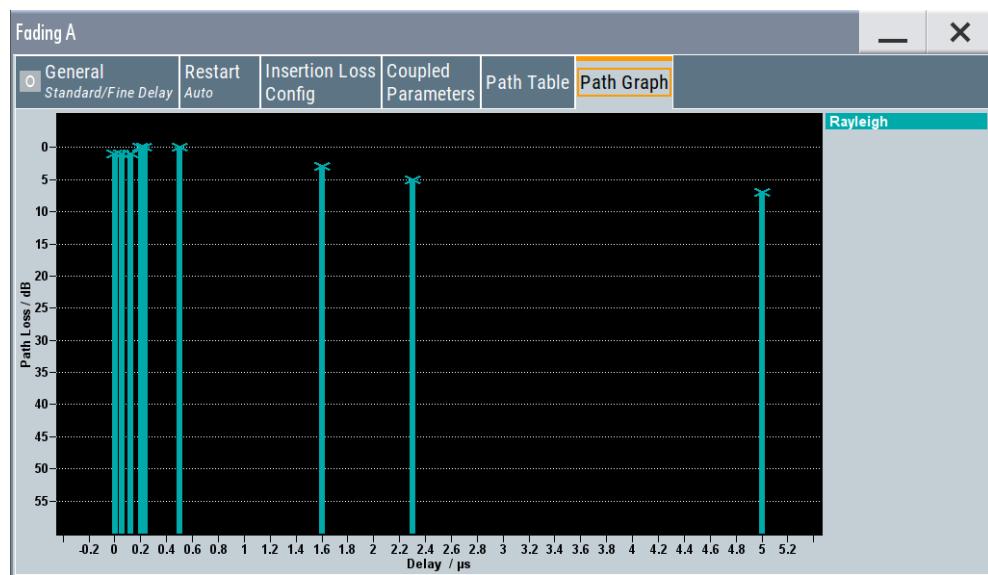

`[ :SOURce<hw>] :FSIMulator:DELay|DEL:GROup<st>:PATH<ch>:LOGNormal:CSTD` on page 179

## 3.5 Path graph

To access the graphical representation of the configured path,

- ▶ select "Fading > Path Graph".

The path graph provides a quick overview of the paths as they are configured in the delay modes.

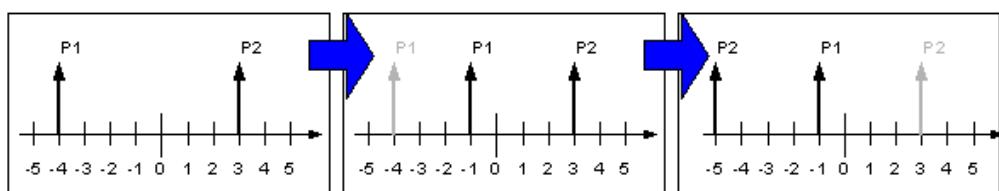

The signal delay is plotted on the x-axis. The minimum value is 0 s. The maximum value is equal to the maximum delay, determined by the sum of [max. Basic Delay](#) and [max. Additional Delay](#). The relative path power is plotted on the y-axis, with 0 dB corresponding to the maximum power on the path (path loss = 0 dB).

Each path is represented by a bar. The color of the bar indicates the fading profile of the path. The color coding for the individual profiles is shown right next to the graphics. The "Path Loss" can be read off from the height of the bar. The minimum value is 0 dB, and the maximum value is – 50 dB.

## 3.6 Birth death propagation

In the "Birth Death Propagation" configuration, the fading simulator simulates dynamic propagation conditions in conformity with the test case 3GPP, 25.104-xxx, annex B4. Here, the behavior of a receiver is tested when it is confronted with the sudden disappearance and reappearance of a signal. This can occur, for example, when a pedestrian making a call walks around the corner of a building.

Two paths are simulated which appear ("Birth") or disappear ("Death") in alternation at arbitrary points in time. The points in time fall within a grid of integer delays [-5, -4, -3, -2, -1, 0, 1, 2, 3, 4, 5] μs. After a certain time ("Hopping Dwell"), a path disappears from a given grid position and appears simultaneously at another randomly chosen grid position. During this hop, the second path remains stable at its grid position. After a further "Hopping Dwell" elapses, the second path changes its position. Now, the first path remains at its position and so on. The two paths never appear at the same time position at the same time (see [Figure 3-5](#)).

*Figure 3-5: Example of a sequence of hops in Birth Death Propagation*

Since it is not possible to generate negative time values (delays), the actual hop range is from 0 to 10  $\mu$ s.

According to annex B4, each path has the same loss and phase and no Doppler shift. The time until the position of a path is changed is also specified (see [Table 3-2](#)).

*Table 3-2: Default parameter values (Birth Death Propagation)*

"Profile"	Pure Doppler
"Path Loss"	0 dB
"Min. Delay"	0 $\mu$ s
"Delay Grid"	1 $\mu$ s
"Positions"	11
"Max. Delay"	10 $\mu$ s
"Hopping Dwell"	191 ms
"Speed"	0 m/s
"Frequency Ratio"	1.0

### Path Graph

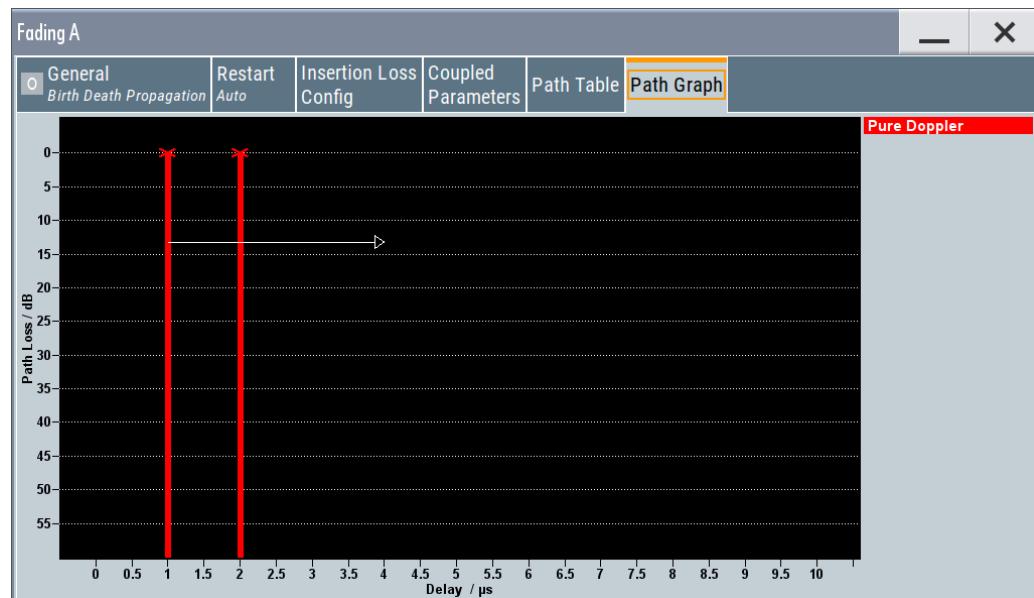

The graphical display of the fading paths in Birth Death Propagation mode shows as an example the changing positions of the two paths within the delay grid. The displayed position change does not correspond to the actual delay hops of the real signal. An arrow indicates the direction of the delay hop of the path that will next change its position, with the head of the arrow marking the new position.

The delay grid is plotted on the x-axis. The permissible delay range and the delay offset are shown in the graphics (see the "Min Delay" and the "Delay Range" indication on the graph). The path power is plotted on the y-axis, with 0 dB corresponding to the maximum power on the path (path loss = 0 dB). The scaling of the axes and the displayed path power match the real settings.

The scaling of the x-axis depends on the set delay range. It always starts at 0  $\mu$ s and ranges up to 40  $\mu$ s at the most (= maximum for delay range). The minimum delay corresponds to the start value of the delay range. The maximum delay is defined by the minimum delay, the delay grid and the number of possible hop positions.

$$\text{Max Delay} = (\text{Positions} - 1) \times \text{Delay Grid} + \text{Min. Delay}$$

The (mean) delay offset is calculated from the minimum and maximum delay ((max. delay - min. delay)/2).

The [Table 3-2](#) lists the default values for Birth Death Propagation. However, these parameters can also be set for further tests in the fading path table.

	Unit	Path 1	Path 2
Profile		Pure Doppler	Pure Doppler
Path Loss	dB	0.000	0.000
Minimal Delay	μs	0.000	
Delay Grid	μs	1.000	
Positions		11	
Maximal Delay	μs	10.00	
Start Offset	μs	0.0	
Hopping Dwell	μs	191 000.0	
Speed	km/h	0.000	
Delay Offset	μs	0.00	

### Settings:

Profile.....	60
Path Loss.....	60
Min Delay.....	60
Delay Grid.....	60
Positions.....	60
Maximum Delay.....	61

Start Offset.....	61
Hopping Dwell.....	61
Speed.....	62
Resulting Doppler Shift.....	62
Frequency Ratio.....	62
Actual Doppler Shift.....	63

**Profile**

Displays the fading profile for birth death propagation. The fading profile has a fixed setting to "Pure Doppler".

A transmission path is simulated in which there is an individual direct connection from the transmitter to the moving receiver (discrete component). The Doppler frequency shift is determined by the "Speed" and "Frequency Ratio" parameters.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:BIRTHdeath:PATH<ch>:PROFile](#) on page 184

**Path Loss**

Enters the loss for the selected path.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:BIRTHdeath:PATH<ch>:LOSS](#) on page 184

**Min Delay**

Enters the minimum delay for the two fading paths.

The minimum delay corresponds to the start value of the delay range.

The delay range is defined by the minimum delay, the delay grid and the number of possible hop positions. It can be in the range between 0 and 40 us.

0 us < (Positions – 1) x Delay Grid + Min. Delay < 40 us

The scaling of the X-axis is adapted according to the entry (see "[Path Graph](#)" on page 58).

Invalid entries are rejected, the next possible value is entered.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:BIRTHdeath:DElay:MINimum](#) on page 183

**Delay Grid**

Enters the delay grid. The value defines the resolution for the possible hop positions of the two fading paths in the delay range.

The scaling of the X-axis is adapted according to the entry (see "[Path Graph](#)" on page 58).

Invalid entries are rejected, the next possible value is entered.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:BIRTHdeath:DElay:GRID](#) on page 183

**Positions**

Enters the number of possible hop positions in the delay range.

The scaling of the X-axis is adapted according to the entry (see "[Path Graph](#)" on page 58).

Invalid entries are rejected, the next possible value is entered.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:BIRTHdeath:POSitions on page 185](#)

### Maximum Delay

Indication of the maximum delay. The maximum delay corresponds to the stop value of the delay range (see "Path Graph" on page 58).

The maximum delay is defined by the minimum delay, the delay grid and the number of possible hop positions.

$$\text{Max Delay} = (\text{Positions} - 1) \times \text{Delay Grid} + \text{Min. Delay}$$

Remote command:

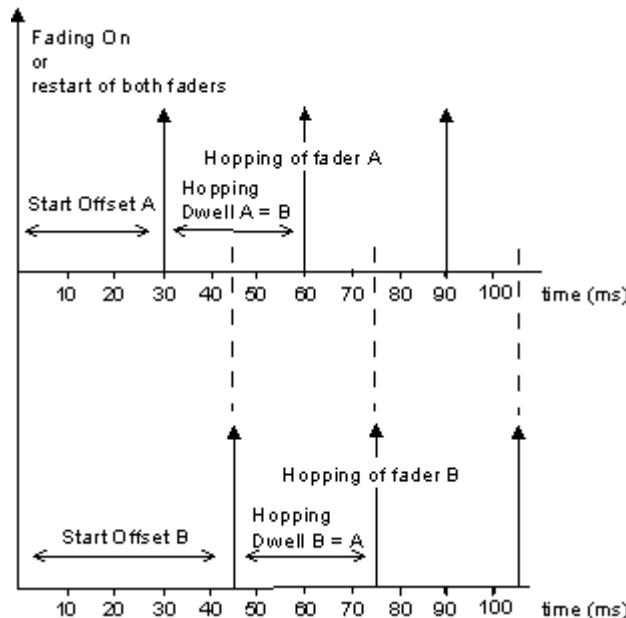

[\[:SOURce<hw>\]:FSIMulator:BIRTHdeath:DElay:MAXimum? on page 183](#)

### Start Offset

Enters the timing offset by which the start of "Birth Death Propagation" is offset with respect to when fading is switched on or a restart as a result of a restart trigger.

This allows the user to precisely displace birth death events with respect to one another during two-channel fading. This is required in some 3GPP base station tests.

If the same hopping dwell time is entered in both faders, the offset will take place by a constant value.

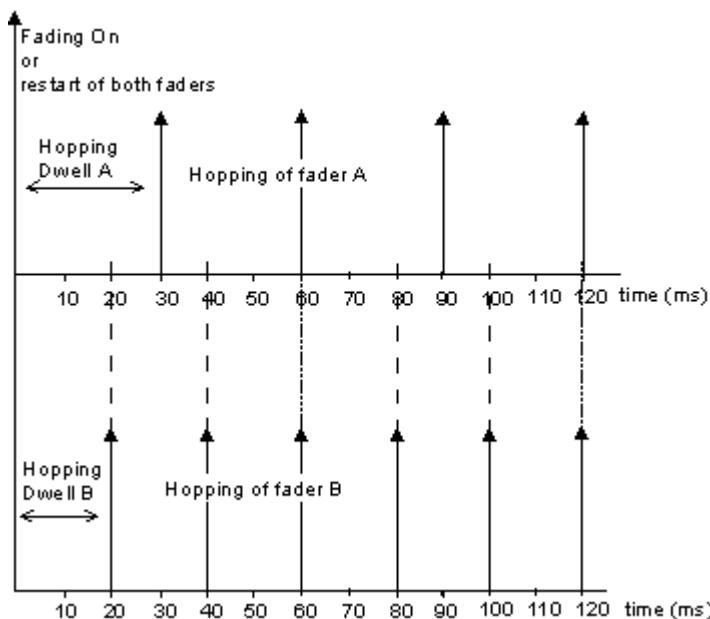

Remote command:

[\[:SOURce<hw>\]:FSIMulator:BIRTHdeath:SOFFset on page 185](#)

### Hopping Dwell

Enters the time until the next change in the delay of a path (birth death event).

During two-channel fading, the dwell times of the two channels can be set independently. This causes the hop time points of the two channels to coincide repeatedly. This is a way of simulating tough receiving conditions as arise when two receiving channels simultaneously change frequency (see figure).

Remote command:

[\[:SOURce<hw>\]:FSIMulator:BIRTHdeath:HOPPing:DWELL](#) on page 184

### Speed

Enters the speed  $v$  of the moving receiver.

The resulting Doppler shift is dependent on the speed  $v$  and the entered ratio of the actual Doppler shift to the set Doppler shift  $f_D$ . This ratio is determined in the "Frequency Ratio" line. The resulting Doppler frequency can be read off from the "Res. Doppler Shift" line. It may not exceed the maximum Doppler frequency.

If the speed is changed, the resulting Doppler shift is automatically modified.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:BIRTHdeath:SPeed](#) on page 185

### Resulting Doppler Shift

Displays the resulting Doppler shift.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:BIRTHdeath:PATH<ch>:FDOPpler?](#) on page 186

### Frequency Ratio

Enters the ratio of the actual Doppler shift to the Doppler shift set with the "Speed" parameter.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:BIRTHdeath:FRATio](#) on page 186

**Actual Doppler Shift**

Displays the actual Doppler shift.

The actual Doppler frequency is determined by the selected "Speed" and "Frequency Ratio" (i.e. the ratio of the actual Doppler frequency to the resulting Doppler frequency).

Remote command:

[ :SOURce<hw>] :FSIMulator:BIRTHdeath:PATH<ch>:FDOPpler:ACTual?  
on page 187

## 3.7 Moving propagation

In the "3GPP/LTE Moving Propagation" configuration, the fading simulator simulates dynamic propagation conditions in conformity with the test case 3GPP TS25.104, annex B3 or 3GPP TS36.141, annex B.4.

The fading simulator enables configuration according to three predefined moving scenarios. The first one represents moving conditions with one reference and one moving channel whereas in the other two all paths are moving.

The predefined scenarios are as follow:

- "Ref. + Mov. Channel" - Simulation of moving propagation conditions in accordance to the 3GPP TS25.104, annex B3.  
(see [Chapter 3.7.1, "Moving propagation conditions for testing of baseband performance", on page 63](#))
- "ETU200Hz Moving" - Simulation of moving propagation conditions in accordance to the scenario 1 described in 3GPP TS36.141, annex B.4.  
(see [Chapter 3.7.2, "Moving propagation conditions for testing the UL timing adjustment performance", on page 66](#))
- "Pure Doppler Moving" - Simulation of moving propagation conditions in accordance to the scenario 2 described in 3GPP TS36.141, annex B.4.  
(see [Chapter 3.7.2, "Moving propagation conditions for testing the UL timing adjustment performance", on page 66](#))

It is also possible to adjust some of the parameters of these predefined scenarios and simulate user-definable moving propagation conditions.

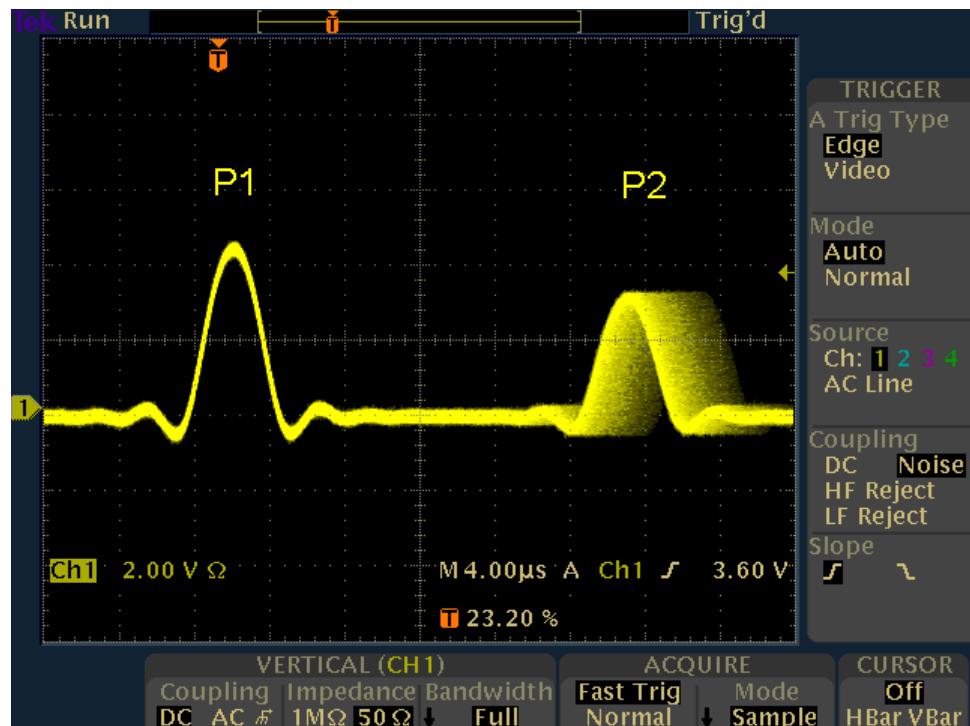

### 3.7.1 Moving propagation conditions for testing of baseband performance

#### Simulating moving propagation conditions for testing of baseband performance

- ▶ To simulate moving propagation conditions for testing of baseband performance in accordance to the 3GPP TS25.104, annex B3:
  - a) select "Configuration > Moving Propagation" and "Moving Channels > One" or
  - b) select "Standard > 3GPP > Moving Propagation > Ref. + Mov. Channel".

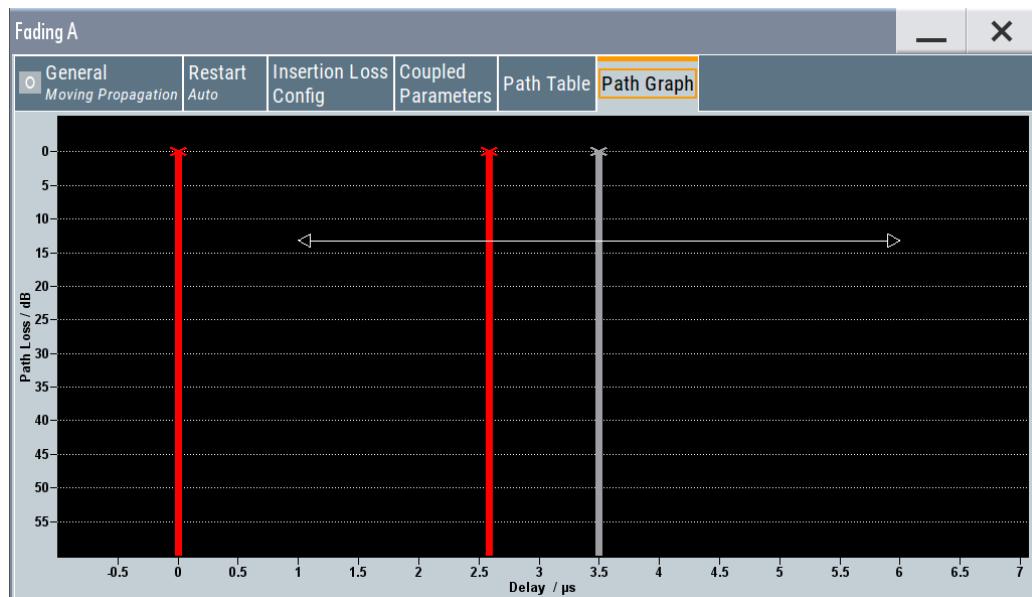

Here, the behavior of a receiver is tested in response to slow delay variations in a signal. Two paths are simulated: Path 1 has fixed delay (Reference Path, P1), while the delay of path 2 varies slowly in a sinusoidal fashion (Moving Path, P2). The two paths have no fading profile. They have the same level, the same phase and no Doppler shift.

The following figure illustrates a baseband signal with ASK modulation (only one 1 bit, then many 0 bits) which was subjected to moving propagation. Path P1 remains still while path P2 moves in time relative to it. As a result of the luminescence setting on the oscilloscope, the way in which P2 wanders over time is clearly visible.

The graphical display of the fading paths in Moving Propagation mode shows as an example the changing positions of the moving path with respect to the stationary reference path. The displayed position change does not correspond to the actual delay changes of the real signal.

The delay grid is plotted on the x-axis. The permissible delay range for the moving path is shown in the graphics by the horizontal arrow. The grey path indicates the set start delay for the Moving Path. The path power is plotted on the y-axis, with 0 dB corresponding to the maximum power on the path (path loss = 0 dB). The scaling of the axes and the displayed path power match the real settings.

The delay  $\Delta\tau_{one}$  of the moving path obeys the following equation:

$$\Delta\tau_{one} = "Delay" + \frac{"Variation(Pk Pk)"}{2} * \sin \frac{2\pi}{"VariationPeriod"}$$

Where the values relate to the values proposed in the test case 3GPP, 25.104xxx, annex B3 as follows:

- Variation (Peak-Peak) = A
- Delay = B + A/2
- Variation Period =  $2\pi / \Delta \omega$

The Table 3-3 list the settings required to attain the values proposed in the test case 3GPP TS25.104, annex B3.

**Table 3-3: Default parameter values (Moving Propagation)**

<b>Reference Path:</b>	"Delay"	0 us
	"Path Loss"	0 dB
	"State"	On
<b>Moving Path:</b>	"Variation (Pk Pk)"	5 us
	"Variation Period"	157 s
	"Delay"	3.5 us
	"Path Loss"	0 dB
	"State"	On

These default values can be changed in the [Path Table](#) dialog.

### 3.7.2 Moving propagation conditions for testing the UL timing adjustment performance

The purpose of the uplink timing adjustments testing is to verify whether the base station sends timing advance commands and whether the base station estimates appropriate the uplink transmission timing.

#### Simulating moving propagation conditions

To simulate moving propagation conditions for testing the UL timing adjustment performance in conformity with the test cases "Moving propagation conditions", as defined in 3GPP 36.141, annex B.4:

- ▶ Select "Standard > LTE > Moving Propagation > ETU200Hz Moving or Pure Doppler Moving"

The Figure 3-6 illustrates the moving propagation conditions for the test of the UL timing adjustment performance.

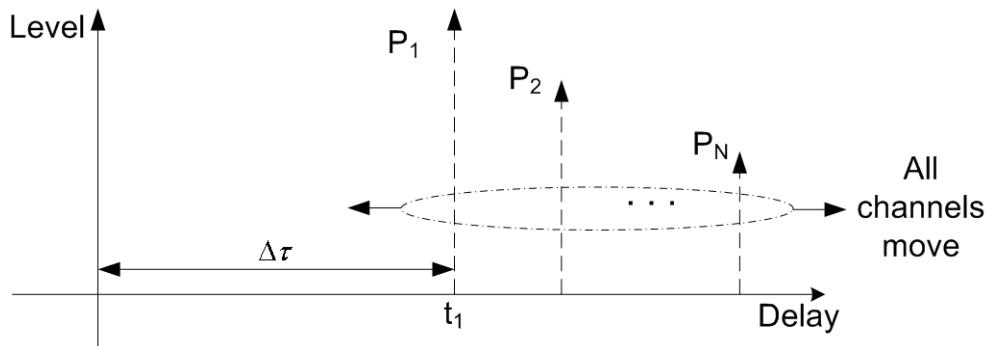

Figure 3-6: Moving Propagation Conditions

Use the parameter "Additional Delay" to configure the relative timing among all paths. The time difference between the reference timing and the first path is according to the following equation:

$$\Delta\tau_{all} = \frac{\text{"Variation(Pk Pk)"} * \sin \frac{2\pi t}{\text{"Variation Period"}}}{2}$$

The 3GPP specification defines the uplink timing adjustments requirements for normal and extreme conditions. The following two scenarios for the testing of UL timing advance are specified:

- Scenario 1: ETU200 ("ETU200Hz Moving") is the scenario for testing in normal conditions.  
This scenario considers ETU channel model and UE speed of 120km/h.
- Scenario 2: AWGN ("Pure Doppler Moving") is the extreme conditions optional scenario.  
The scenario corresponds to AWGN channel model and UE speed of 350km/h.

The fading simulator generates the signals for these scenarios in according to the parameters defined in the 3GPP specification (see table [Table 3-4](#)). However, the fading simulator also allows the re-configuration of some of the predefined values.

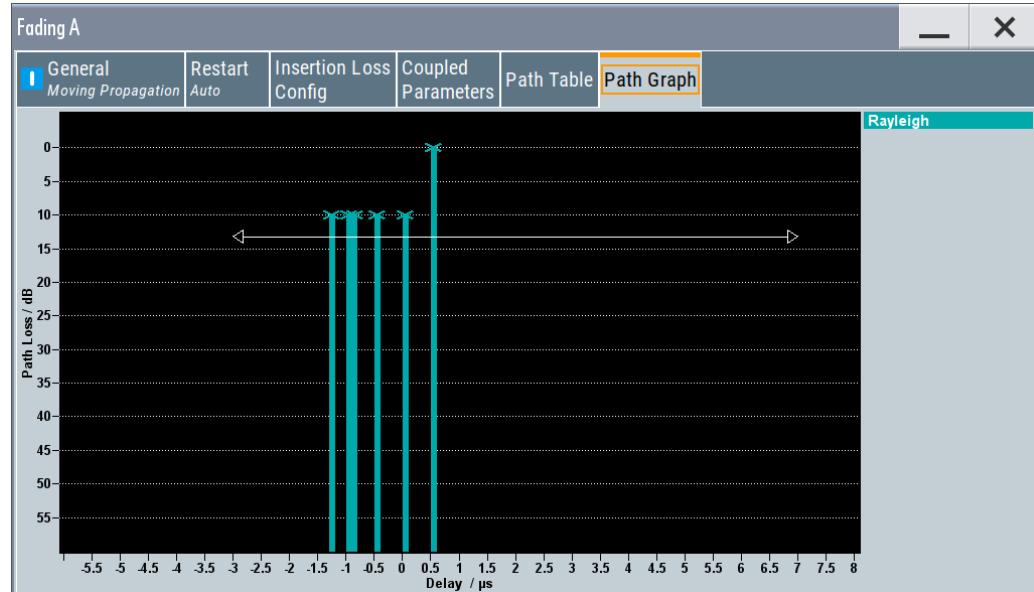

**Table 3-4: Default parameter values**

Parameter	Scenario 1	Scenario 2
Channel Model	ETU200Hz Moving	Pure Doppler
UE speed	120 km/h	350 km/h
CP length	Normal	Normal
"Variation (Peak-Peak)"	10 $\mu$ s	10 $\mu$ s
$\Delta\omega$	0.04 1/s	0.13 1/s
"Variation Period" = $2\pi/\Delta\omega$	157.1 s	48.3 s

### 3.7.2.1 Scenario 1

Here, the behavior of a moving receiver is tested, i.e. the simulated scenario represents a moving receiver that changes its distance to the base station. The Fading Simulator generates the signal as a sequence of complete cycles of approach towards to the BS antenna and moving away from it.

Per default, three Rayleigh path groups with three paths each are simulated. All paths move.

The path group 1 has a fixed delay ("Basic Delay = 0 s"); the "Basic Delay" of the other two path groups can be configured. The relative timing among all paths is determined by the parameter "Additional Delay".

The three path groups have the same phase and speed; the Doppler shift is calculated as a function of the selected speed.

### 3.7.2.2 Scenario 2

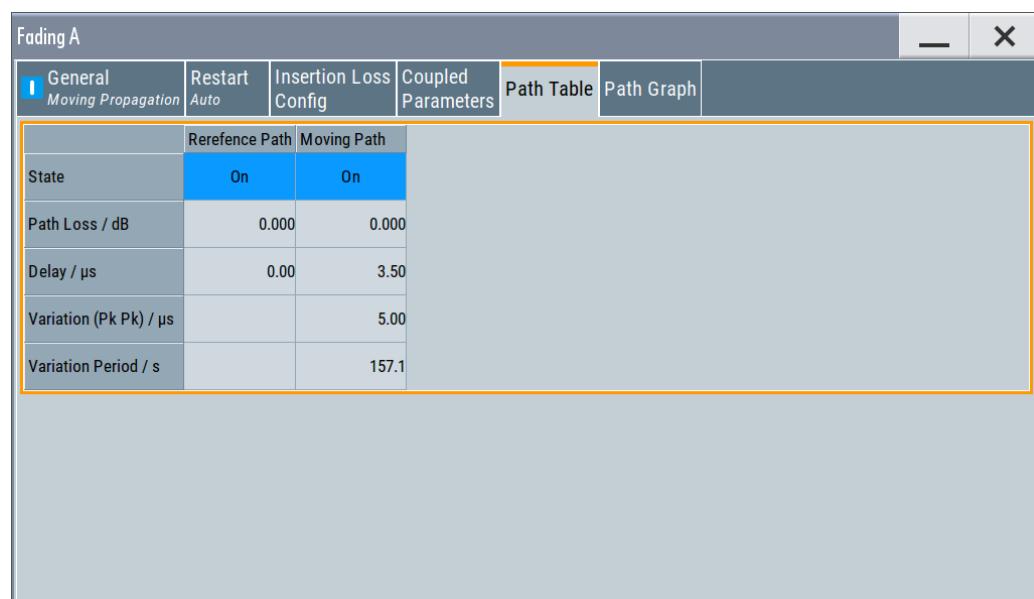

One path without a fading profile (Pure Doppler) is simulated. The path has constant level and constant speed.

### 3.7.3 Path tables moving propagation

The parameters available for configuration depend on the selected number of [Moving Channels](#), one or all.

#### 3.7.3.1 One moving channel

- To access the settings for configuring the moving and the reference path for the moving propagation with one moving channel, perform one of the following:
  - select "Fading > Standard > 3GPP > Ref. + Mov. Channel"
  - select "Fading > Configuration > Moving Propagation" and "Moving Channels > One".

#### Settings:

<a href="#">Reference Path Settings</a> .....	69
└ <a href="#">State</a> .....	69
└ <a href="#">Path Loss</a> .....	69
└ <a href="#">Delay</a> .....	69
<a href="#">Moving Path Settings</a> .....	69
└ <a href="#">State</a> .....	69
└ <a href="#">Path Loss</a> .....	69

└ Delay.....	69
└ Variation (Peak-Peak).....	69
└ Variation Period.....	70

### **Reference Path Settings**

The following settings are provided:

#### **State ← Reference Path Settings**

Activates reference path P1 for moving propagation.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:MDELay:REFerence:STATE](#) on page 196

#### **Path Loss ← Reference Path Settings**

Enters the loss for the reference path.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:MDELay:REFerence:LOSS](#) on page 196

#### **Delay ← Reference Path Settings**

Enters the delay for the reference path.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:MDELay:REFerence:DElay](#) on page 196

### **Moving Path Settings**

The following settings are provided:

#### **State ← Moving Path Settings**

Activates moving fading path P2 for moving propagation.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:MDELay:MOVing:STATE](#) on page 195

#### **Path Loss ← Moving Path Settings**

Enters the loss for the moving fading path.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:MDELay:MOVing:LOSS](#) on page 195

#### **Delay ← Moving Path Settings**

Enters the average delay for the moving fading path.

The delay of the moving path slowly varies sinusoidal within the set variation range around this delay.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:MDELay:MOVing:DElay:MEAN](#) on page 194

#### **Variation (Peak-Peak) ← Moving Path Settings**

Enters the range for the delay of the moving fading path for moving propagation. The delay of the moving path slowly varies sinusoidal within this range around the set mean delay.

Remote command:

[[:SOURce<hw>\]:FSIMulator:MDelay:MOVing:DELay:VARiation](#) on page 194

### Variation Period ← Moving Path Settings

Period duration for delay variation. A complete variation cycle is passed through in this time.

Remote command:

[[:SOURce<hw>\]:FSIMulator:MDelay:MOVing:VPERiod](#) on page 195

#### 3.7.3.2 All moving channels

- ▶ To access the settings for configuring the moving path groups and their paths, perform one of the following:
  - a) select "Fading > Standard > LTE > Moving Propagation > ETU200Hz Moving"
  - b) select "Fading > Standard > LTE > Moving Propagation > Pure Doppler Moving"
  - c) select "Fading > Configuration > Moving Propagation" and "Moving Channels > All".

The number and the parameters of the predefined paths depend on the selected scenario.

		Delay Variation (Peak-Peak)								Variation Period	
		10.00 µs								157.1 s	
	Unit	1 1	1 2	1 3	2 1	2 2	2 3				
State		On	On	On	On	On	On	On	On	On	On
Profile		Rayleigh	Rayleigh	Rayleigh	Rayleigh	Rayleigh	Rayleigh	Rayleigh	Rayleigh	Rayleigh	Rayleigh
Path Loss /dB		1.000	1.000	1.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000
Basic Delay /µs	µs	0.000 000	0.000 000	0.000 000	0.000 000	0.000 000	0.000 000	0.000 000	0.000 000	0.000 000	0.000 000
Additional Delay /µs	µs	0.000 000	0.050 000	0.120 000	0.200 000	0.230 000	0.500				
Resulting Delay /µs	µs	0.000 000	0.050 000	0.120 000	0.200 000	0.230 000	0.500				
Const Phase /Deg	Deg	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0
Speed /km/h	km/h	215.849	215.849	215.849	215.849	215.849	215.849	215.849	215.849	215.849	215.849

The most parameters in the "Path Table" correspond to the parameters described in Chapter 3.4, "Path table", on page 44.

**Settings:**

<a href="#">Delay Variation (Peak-Peak)</a> .....	71
<a href="#">Variation Period</a> .....	71

**Delay Variation (Peak-Peak)**

Enters the range for the delay of the moving fading paths for moving propagation with all moving channels. The delay of the moving path slowly varies sinusoidal within this range around the set mean delay.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:MDelay:ALL:MOVing:DElay:VARIation](#)  
on page 193

**Variation Period**

Period duration for delay variation. A complete variation cycle is passed through in this time.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:MDelay:ALL:MOVing:VPERiod](#) on page 192

## 3.8 Two channel interferer

In the "2 Channel Interferer" configuration, the fading simulates dynamic propagation in conformity with the test cases 5 and 6 from MediaFlo. Here, path 1 has a fixed delay while the delay of path two either varies slowly in a sinusoidal way or appears in alternation at arbitrary points in time. Thus, 2 channel interferer fading can be considered as a combination of birth death propagation fading and moving propagation fading. The main difference is the broader range of propagation obtainable with 2 channel interferer fading.

Each of the fading profiles "Static Path", "Pure Doppler" and "Rayleigh" can be allocated to the two paths.

**Predefined Setting**

The [Table 3-5](#) and [Table 3-6](#) list the settings required to attain the values proposed in the MediaFlo test case 5 and 6.

*Table 3-5: Test Case 5*

<b>Reference Path:</b>	"Profile"	Static Path
	"Relative Delay"	10 us
	"Average Power"	-3 dB
	"Fading Type"	Rayleigh, 60 km/h
	"Doppler Spectrum"	Classic 6 dB
	"Static Delay"	40 us
<b>Moving Path:</b>	"Profile"	Hopping

	"Relative Delay"	0/110 us
	"Average Power"	-3 dB
	"Fading Type"	Static
	"Doppler Spectrum"	N/A
	"Dwell Time"	2.9 s

**Table 3-6: Test Case 6**

<b>Reference Path:</b>	"Profile"	Static Path
	"Relative Delay"	100 us
	"Average Power"	-3 dB
	"Fading Type"	Static
	"Doppler Spectrum"	N/A
<b>Moving Path:</b>	"Profile"	Sliding
	"Relative Delay"	0/200 us
	"Average Power"	-3 dB
	<b>Fading Type</b>	Rayleigh, 3 km/h
	"Doppler Spectrum"	Classic 6 dB
	"Period"	160 s

### How to use the provides settings and configure a 2 channel interfering signal

The following are two examples on how to configure a "2 Channel Interferer" conditions. See how to:

- ["To enable a hopped moving mode"](#) on page 72
- ["To enable a sliding moving mode"](#) on page 73

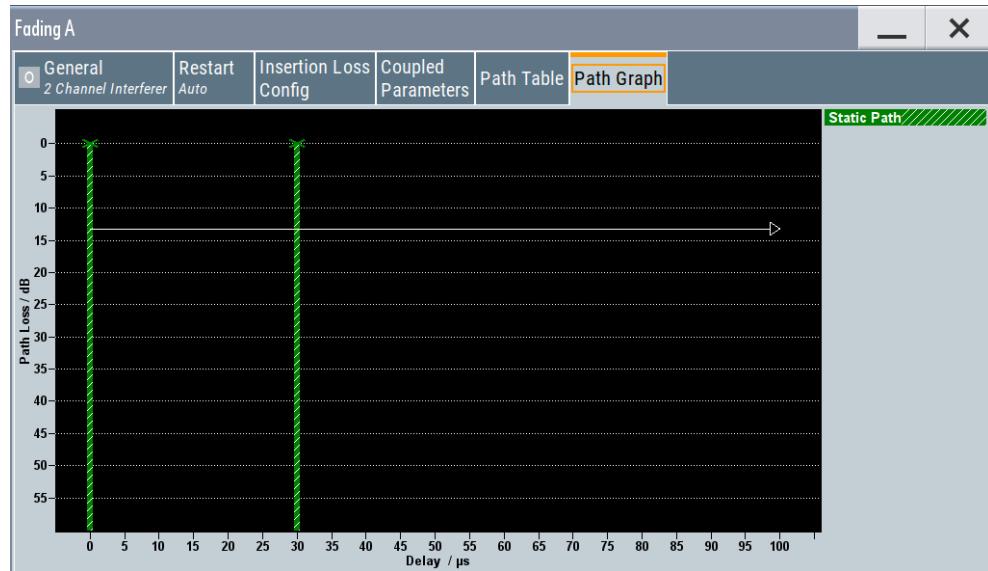

#### To enable a hopped moving mode

Enable a 2 channel interfering signal with the following settings:

1. Reference Path:
  - a) "Delay Min = 30 µs"
  - b) "Profile = Static Path"
  - c) "Path Loss = 0 dB"
2. Moving Path:
  - a) "Delay Min = 0 µs"
  - b) "Profile = Static Path"
  - c) "Path Loss = 0 dB"
  - d) "Delay Max = 100 µs"
  - e) "Moving Mode > Hopping"
3. Enable "Reference Path > State > On" and "Moving Path > State > On"

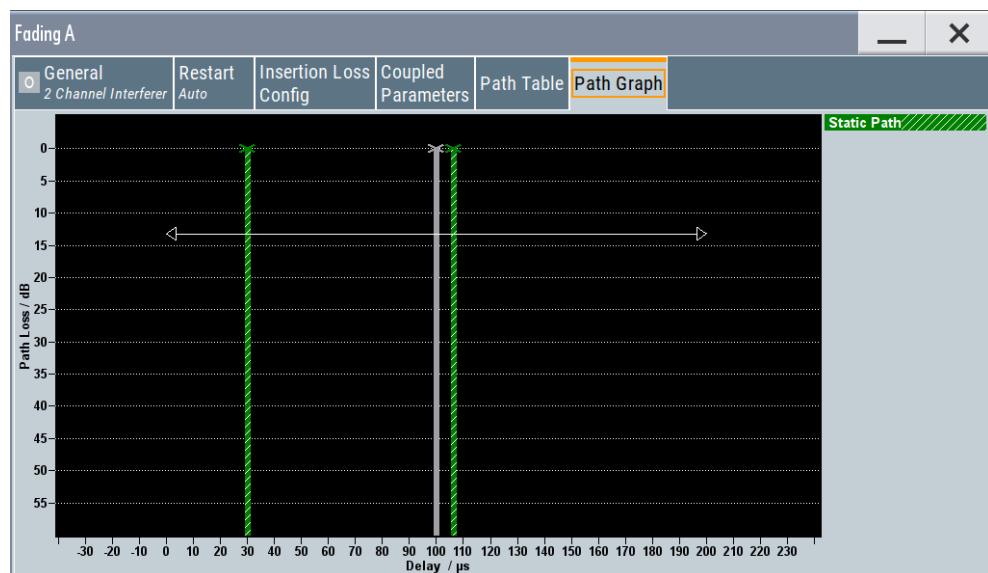

- Open the "Fading > Path Graph" view.

The following figure shows the resulting path graph.

#### To enable a sliding moving mode

- Use the settings of "To enable a hopped moving mode" on page 72.
- Change the "Moving Mode > Sliding".
- Open the "Fading > Path Graph" view.

The moving path slides from the minimum delay (30 us) to the maximum delay (100 us) and back. The grey bar indicates the mean delay of the moving path. The horizontal arrow indicates the permissible delay range for the moving path. The displayed position change does not correspond to the actual delay changes of the real signal.

## 2 Channel Interferer Settings

The [Table 3-5](#) and [Table 3-6](#) list the default values for "2 Channel Interferer" configuration. You can use these default values and/or adjust the provided settings in the fading path table.

Fading A					
General 2 Channel Interferer		Restart	Insertion Loss Config	Coupled Parameters	Path Table
	Unit	Reference Path	Moving Path		
State		On	On		
Profile		Static Path	Pure Doppler		
Path Loss	dB	0.0	0.0		
Speed	km/h	3.000			
Res. Doppler Shift	Hz	2.78	2.78		
Frequency Ratio		0.000 0	0.000 0		
Act. Doppler Shift	Hz	2.78	0.00		
Delay Min	µs	40.00	0.00		
Delay Max	µs		110.00		
Moving Mode			Hopping		
Period/Dwell	s	2.90			

### Settings:

<a href="#">State</a>	74
<a href="#">Profile</a>	75
<a href="#">Path Loss</a>	75
<a href="#">Speed</a>	75
<a href="#">Freq. Ratio</a>	75
<a href="#">Res. Doppler Shift</a>	75
<a href="#">Act. Doppler Shift</a>	76
<a href="#">Delay Min</a>	76
<a href="#">Delay Max (Moving Path)</a>	76
<a href="#">Moving Mode (Moving Path)</a>	76
<a href="#">Period/Dwell</a>	76

#### State

Activates/deactivates either the reference path or the moving path for 2 channel interferer fading.

Remote command:

[**:SOURce<hw>]:FSIMulator:TCINTERFERER[:STATE]** on page 219  
[**:SOURce<hw>]:FSIMULATOR:TCINTERFERER:REFERENCE|MOVING:STATE**  
on page 222

#### Profile

Selects the fading profile either for the reference path or the moving path to be used for 2 channel interferer fading.

Remote command:

[**:SOURce<hw>]:FSIMULATOR:TCINTERFERER:REFERENCE|MOVING:FDOOPPLER?**  
on page 221

#### Path Loss

Sets the attenuation of either the reference path or moving path to be used for 2 channel interferer fading.

Remote command:

[**:SOURce<hw>]:FSIMULATOR:TCINTERFERER:REFERENCE|MOVING:LOSS**  
on page 222

#### Speed

(Rayleigh only)

Enters the speed v of the moving receiver. The unit for entering the speed under "Speed Unit" can be chosen in the upper section of the menu.

The resulting Doppler shift is dependent on the speed v and the entered ratio of the actual Doppler shift to the set Doppler shift  $f_D$ . This ratio is determined in the "Frequency Ratio" line. The resulting Doppler frequency can be read off from the "Res. Doppler Shift" line. It may not exceed the maximum Doppler frequency.

If the speed is changed, the resulting Doppler shift is automatically modified.

Remote command:

[**:SOURce<hw>]:FSIMULATOR:TCINTERFERER:SPEED** on page 220

#### Freq. Ratio

Enters the ratio of the actual Doppler shift to the Doppler shift set with the "Speed" parameter.

Remote command:

[**:SOURce<hw>]:FSIMULATOR:TCINTERFERER:REFERENCE|MOVING:FRATIO**  
on page 221

#### Res. Doppler Shift

Displays the actual Doppler shift.

The actual Doppler frequency is determined by the entered "Speed" and the entered ratio of the actual Doppler frequency to the set Doppler frequency ("Frequency Ratio").

Remote command:

[**:SOURce<hw>]:FSIMULATOR:TCINTERFERER:REFERENCE|MOVING:FDOOPPLER?**  
on page 221

**Act. Doppler Shift**

Displays the actual Doppler shift.

Remote command:

[**:SOURce<hw>]:FSIMulator:TCINTERFERER:REFERENCE|MOVING:FDOOPLER:ACTUAL?** on page 221

**Delay Min**

Enters the minimum delay for either the reference path or the moving path.

The minimum delay of the moving path corresponds to the start value of the delay range.

The delay range is defined by the minimum delay and the maximum delay.

The scaling of the x-axis is adapted according to the entry.

Invalid entries are rejected, the next possible value is entered.

Remote command:

[**:SOURce<hw>]:FSIMULATOR:TCINTERFERER:REFERENCE|MOVING:DELAY:MINIMUM** on page 220

**Delay Max (Moving Path)**

Enters the maximum delay for the moving path.

The maximum delay of the moving path corresponds to the end value of the delay range.

The delay range is defined by the minimum delay and the maximum delay.

The scaling of the x-axis is adapted according to the entry.

Invalid entries are rejected, the next possible value is entered.

Remote command:

[**:SOURce<hw>]:FSIMULATOR:TCINTERFERER:REFERENCE|MOVING:DELAY:MAXIMUM** on page 219

**Moving Mode (Moving Path)**

Selects the Type of moving applied to the moving path.

"Sliding"      The reference path has a fix delay while the delay of the moving path varies slowly in a sinusoidal way.

"Hopping"      The reference path has a fix delay while the delay of the moving path appears or disappears in alternation at arbitrary points in time.

Remote command:

[**:SOURce<hw>]:FSIMULATOR:TCINTERFERER:REFERENCE|MOVING:MMODE** on page 219

**Period/Dwell**

Enters either the dwell time or the period of a complete cycle for the moving path depending on the selected **Moving Mode (Moving Path)**.

"Moving Mode"	"Period Dwell"
"Sliding"	sets the period for a complete cycle of the moving path
"Hopping"	sets the dwell time of the moving path

The gradient of the delay/period ratio may not fall below  $6\mu\text{s}/\text{s}$ , that is, the minimum value of the period depends on the value of the delay.

If the value for the delay is increased in a way that the value for the gradient falls below  $6\mu\text{s}/\text{s}$ , the value for the period is recalculated automatically.

#### Example:

"Delay Min" = 20 us, "Delay Max" = 120 us, "Moving Mode = Sliding"

$[("Delay max" - "Delay min")/2]*2\pi] / "Period/Dwell" = 6$

"Period/Dwell" =  $314/6 = 52.36 \text{ s}$

The value cannot be decreased below this value.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:TCINterferer:PERiod](#) on page 220

## 3.9 Customized dynamic fading

Option: R&S SMW-K820

Customized dynamic fading (CDF) allows you to import dynamic fading list files and to vary the fading parameters path loss, Doppler shift and delay over time.

Customized dynamic fading is a suitable solution in the following cases:

- If advanced dynamic fading models like the customized high-speed train scenarios (cHST) are required.
- If a simulation based on measured real-world channel conditions is required  
Such requirements are, for example, the UE tests in the context of performance analysis.

Depending on the used configuration, the following types of dynamic fading list files are supported:

- ["Customized dynamic fading with \\*.fad\\_udyn files for SISO and MIMO configurations"](#) on page 77
- ["Human-readable customized dynamic fading files for SISO configurations"](#) on page 78

#### Customized dynamic fading with \*.fad\_udyn files for SISO and MIMO configurations

This fading configuration consists of up to 12 fading paths that you can activate individually. All fading paths use Rayleigh fading profile but you can also assign a pure Doppler profile or static fading profile to the first four paths.

The dynamic fading list files are application-specific list files in a Rohde & Schwarz proprietary file format in binary form and with the predefined file extension \*.fad\_udyn. Such files can originate, for example, from drive test measurements. Convert the measurement results in the required binary file format before loading the files in fading simulator.

### Human-readable customized dynamic fading files for SISO configurations

Fading configurations like 1x1x1 or 2x1x1 SISO consist of one fading channel or up to 12 fading paths. You can assign the dynamic fading list files to the second, third or forth fading paths. These paths can use a pure Doppler, Rayleigh or static fading profile.

The following applies for the dynamic fading list files:

- Mandatory keyword `customer` in the filename.  
\*customer\*.fad\_udyn, where \* stays for user-defined filename.
- Mandatory file extension \*.fad\_udyn.
- Predefined file structure, see [Example "Customized dynamic fading file content" on page 78](#).
  - Mandatory file heading with syntax  
`Interval[us] Delay[ms] Fd[kHz] Pathloss[dB]`, where:  
`Interval[us]` gives the time in  $\mu$ s, relative to the fader start. File content is repeated when last time interval is reached.  
`Delay[ms]` is the actual delay in ms  
`Fd[kHz]` is the Doppler frequency in kHz  
`Pathloss[dB]` is the path loss in dB
  - File contains four columns separated by blanks  
Each file row can vary the fading parameters delay, Doppler shift and path loss over time

#### Example: Customized dynamic fading file content

```
Interval[us] Delay[ms] Fd[kHz] Pathloss[dB]
100 7.534877 47.055121 15.554548
100 7.534874 47.055121 15.554545
100 7.534873 47.055121 15.554542
...
...
```

#### Creating and converting human-readable customized dynamic fading files

1. Create a human-readable customized dynamic fading file with any text editor.
2. Rename the file afterwards to follow the naming convention. Add the mandatory extension.  
See ["Human-readable customized dynamic fading files for SISO configurations" on page 78](#).
3. Load the file in the fading simulator. See ["Configuring and enabling "Customized Dynamic" fading profiles" on page 79](#).

4. In the "Path Table", select "Convert > On" to convert the file into the Rohde & Schwarz proprietary file format.
5. Enable fading simulator. Set "Fading > General > State > On".

The R&S SMW converts the file into the Rohde & Schwarz proprietary file format and saves on the hard drive.

As long as the file content remains unchanged, converting the file once, after it is loaded for the first time, is sufficient. Each time you start the fading simulator with enabled custom fading, the R&S SMW loads the file automatically from the hard drive.

#### Configuring and enabling "Customized Dynamic" fading profiles

1. Select "Fading > General Setting > Configuration > Customized Dynamic"
2. Select "Path Table".

	State	Profile	Filename	Correlation	Convert
1	ON	Pure Doppler	/opt/data/Lists/Fad/CustomizedDynamic/CDF_PathLoss	Vector...	<input checked="" type="checkbox"/>
2	ON	Pure Doppler	/opt/data/Lists/Fad/CustomizedDynamic/CDF_Velocity	Vector...	<input checked="" type="checkbox"/>
3	OFF	Pure Doppler		None	Vector... <input checked="" type="checkbox"/>
4	OFF	Pure Doppler		None	Vector... <input checked="" type="checkbox"/>
5	OFF	Rayleigh		None	Matrix... <input checked="" type="checkbox"/>
6	OFF	Rayleigh		None	Matrix... <input checked="" type="checkbox"/>
7	OFF	Rayleigh		None	Matrix... <input checked="" type="checkbox"/>
8	OFF	Rayleigh		None	Matrix... <input checked="" type="checkbox"/>

The displayed settings and the number of fading paths depend on the configuration (SISO or MIMO).

3. To load a fading list file, select "Filename > Select Predefined File".  
Select one of the predefined files, e.g. CDF\_PathLoss.
4. To load user-defined \*.fad\_udyn files, transfer them to the R&S SMW. Load them accordingly.
5. Only if you load a custom fading list with filename like \*customer\*.fad\_udyn for the first time, set "Convert > On".
6. Enable fading simulator. Set "Fading > General > State > On".

**Settings:**

<b>State</b>	.....	80
<b>Profile</b>	.....	80
<b>Filename</b>	.....	80
<b>Correlation</b>	.....	80
<b>Convert</b>	.....	81

**State**

If a fading list file is loaded, this parameter activates the path.

Each change of the state of a path causes a restart of the fader and therefore a restart of all dynamic lists.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:CDYNamic:PATH<ch>:STATE](#) on page 239

**Profile**

Sets the used profile. Per default, all fading paths use Rayleigh profile.

"Static Path" Fading profile for all paths.

"Pure Doppler" Fading profile for paths 1 to 4.

"Rayleigh" Fading profile for all paths.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:CDYNamic:PATH<ch>:PROF](#) on page 239

**Filename**

You can load predefined or user-defined application-specific fading list files.

The fading list files are files in a Rohde & Schwarz proprietary file format and with the predefined file extension \*.fad\_udyn.

Such files can originate, for example, from drive test measurements. Convert the measurement results in the required file format before loading the file in the file simulator.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:CDYNamic:CATalog?](#) on page 238

[\[:SOURce<hw>\]:FSIMulator:CDYNamic:CATalog:USER?](#) on page 238

[\[:SOURce<hw>\]:FSIMulator:CDYNamic:PATH<ch>:DATA:DSElect](#)  
on page 238

[\[:SOURce<hw>\]:FSIMulator:CDYNamic:DElete](#) on page 239

**Correlation**

In MIMO configurations, access dialogs to configure the correlation settings:

"Vector" For the "Pure Doppler" paths, opens the "Relative Tap Gain Vector" dialog where you can configure the phase shift of the selected path. For description, see [Chapter 5.3.3, "Relative gain vector matrix settings", on page 106](#).

"Matrix" For the "Rayleigh" paths, opens the "Correlation Matrix" dialog. Available is only the "Matrix Mode > Individual", see [Chapter 5.3.2, "Correlation matrix table", on page 104](#).

### Convert

If enabled, files with filename like `*customer*.fad_udyn` are converted into the Rohde & Schwarz proprietary file format when the fading simulator is enabled. Converted files are saved on the hard drive.

As long as the file content remains unchanged, converting the file once, after it is loaded for the first time, is sufficient. Each time you start the fading simulation with enabled custom fading, the R&S SMW loads the file automatically from the hard drive.

If `*customer*.fad_udyn` files are used but there is no converted file available and you try to enable fading simulation, an error message appears.

If you use predefined `*.fad_udyn` files or user-defined application-specific fading list files created from drive test measurements for examples, the convert function has no effect. Set "Convert > Off" in this case.

See:

- ["Human-readable customized dynamic fading files for SISO configurations"](#)  
on page 78.
- ["Creating and converting human-readable customized dynamic fading files"](#)  
on page 78.

Remote command:

`[ :SOURce<hw> ] :FSIMulator:CDYNamic:PATH<ch>:CONVert:STATE`  
on page 240

## 3.10 High-speed train

In the "High Speed Train" configuration, the fading simulator simulates propagation conditions in conformity with the test case "High-speed train conditions", as defined in 3GPP TS 25.141, annex D.4A and 3GPP TS 36.141, annex B.3. Here, the behavior of a receiver in high-speed train conditions is tested, i.e. the simulated scenario represents a fast moving receiver that drives past an antenna. The fading simulator generates the signal as a sequence of complete cycles of approach towards to the BS antenna and departure from it.

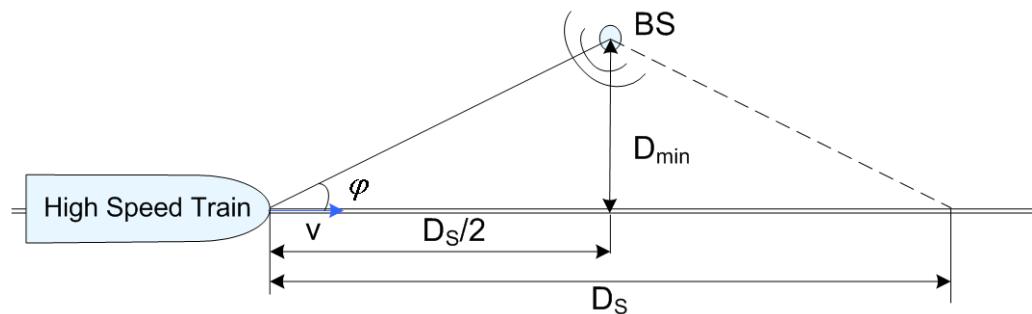

Figure 3-7: High-speed train propagation

Three high-speed scenarios are defined:

- Scenario 1: Open space
- Scenario 2: Tunnel with leaky cable

- Scenario 3: Tunnel for multi-antennas

### 3.10.1 Scenario 1 and scenario 3

For each of the scenarios 1 and 3, one path without a fading profile is simulated (Pure Doppler). The path has constant level, no delay and variable Doppler shift.

The Doppler shift for these scenarios is calculated as follows:

$$f_A(t) = f_D \cos \varphi(t)$$

Where  $f_A(t)$  is the actual Doppler shift and  $f_D$  is the maximum Doppler frequency.

The cosine of angle is given by:

$$\cos \varphi(t) = \frac{D_s/2 - vt}{\sqrt{D_{\min}^2 + (D_s/2 - vt)^2}}, \quad 0 \leq t \leq D_s/v$$

Where:

- $D_s/2$  is the distance in meters between the train and the BS at the beginning of the simulation
- $D_{\min}$  is the minimum distance in meters between the BS and the railway track
- $v$  is the velocity of the train in m/s
- $t$  is time in seconds

For scenario 1 and for BS with receiver diversity, the Doppler shift variation is the same between the antennas.

### 3.10.2 Scenario 2

Scenario 2 is not defined for EUTRA/LTE test cases.

For scenario 2, one Rician fading propagation channel with Rician factor  $K=10$  dB and with one tap is simulated. The Rician factor  $K$  is defined as the ratio between the dominant signal power and the variant of the other weaker signals (see "[K \(Rician factor\)](#)" on page 86).

### 3.10.3 High-speed train scenario parameters

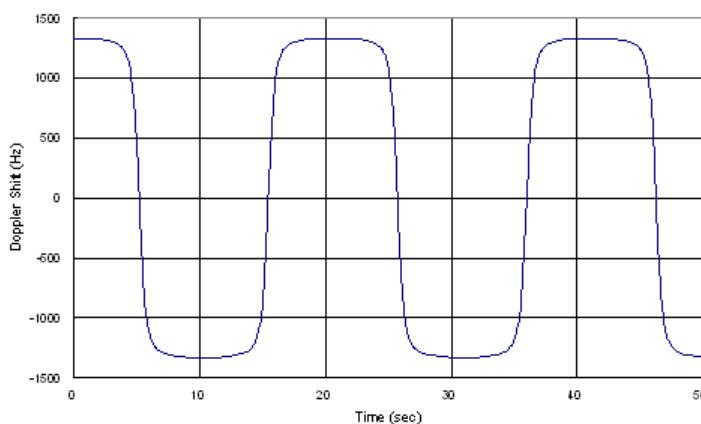

The [Table 3-7](#) gives an overview of the parameters of the HST test scenarios according to the test case "High-speed train conditions".

*Table 3-7: Parameters for high-speed train conditions*

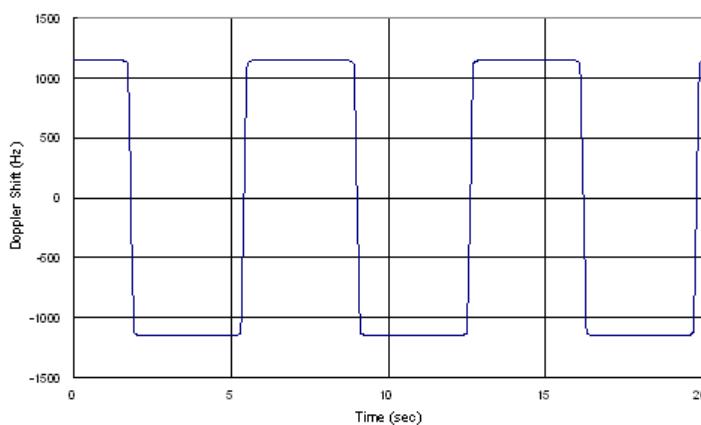

Parameter	Value		
	Scenario 1	Scenario 2	Scenario 3
$D_s$	1000 m	Infinity	300 m

Parameter	Value		
D <sub>min</sub>	50 m	-	2 m
K	-	10 dB	-
v	350 km/h	300 km/h	300 km/h
f <sub>D</sub>	1340 Hz	1150 Hz	1150 Hz

The [Figure 3-8](#) and [Figure 3-9](#) show the trajectory of the Doppler shift for scenario 1 and 3 for the test parameters specified in the test case. For these two scenarios, the Doppler shift trajectories for any user-defined parameters are also displayed in the "3GPP HST" dialog.

*Figure 3-8: Doppler shift trajectory for scenario 1*

*Figure 3-9: Doppler shift trajectory for scenario 3*

### Doppler shift calculation

The HST scenarios are defined for the UE and for the BS tests. In the fading simulator, the same standards are used for both test cases. Consider however, the following difference in the calculation of the Doppler shift:

- In *HST UE tests*, the resulting Doppler shift is based *only* on the used DL frequency.
- In *HST BS tests*, the DL signal itself already contains a Doppler shift. The UE synchronizes on this shifted DL frequency. The simulated UL signal contains a Doppler shift, too.  
The resulting Doppler shift is then based *on both*, the UL and the DL frequency.

To enable the fading simulator to consider the DL Doppler shift, use the following two parameters:

- Consider DL RF
- Virtual DL RF

### General recommendations on performing HST BS tests

The following is a list of the general steps required to enable the fading simulator to generate the signal required for the HST BS tests

1. Set the "RF Frequency" of the instrument to the  $F_{UL}$ , as defined in the specification.
2. Enable a high-speed train scenario with extension "(DL+UL)" in its name.
3. If not enabled, activate the parameter "Fading > (HST) Path Table > Consider DL RF > On".
4. Set the value of the parameter "Fading > (HST) Path Table > Virtual DL RF" to the  $F_{DL}$ , as defined in the specification.

### Example: Configuring the fading simulator to generate an HST BS test signal according to 3GPP TS 36.104

For frequency band 1 tests, the specification defines:  $F_{DL} = 2.14$  GHz and  $F_{UL} = 1.95$  GHz. The resulting Doppler shift is  $F_D = 1140$  Hz.

- In the status bar, select "Frequency =  $F_{UL} = 1.95$  GHz"
- Select "Fading A > Fading Settings > Standards" and navigate to the required high-speed train scenario "3GPP > High Speed Train > HST 3 Tunnel Multi Antenna (DL +UL)"
- If not enabled, activate the parameter "Fading > Path Table > Consider DL RF > On".
- Select "Fading > Path Table > Virtual DL RF =  $F_{DL} = 2.14$  GHz"
- Select "Fading > Fading Settings > State > On"
- Use the command `[:SOURce<hw>]:FSIMulator:HSTRain:FDOPpler?` to query the resulting Doppler shift.

Compare the example below and the Doppler shift trajectory specified in the 3GPP TS36.104.

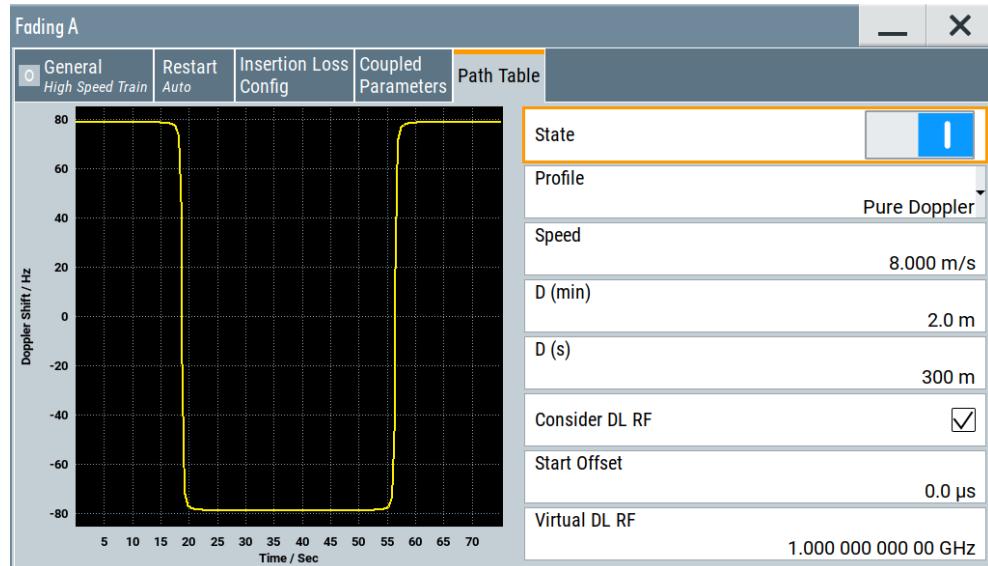

### High-speed train scenario settings

To access these settings:

1. Select "Fading > Fading Settings > Standards".

2. Navigate to the required high-speed train scenario, e.g. "3GPP > High Speed Train > HST 3 Tunnel Multi Antenna (DL+UL)"

The "3GPP HST" dialog displays the default values of the high-speed train scenarios and allows you to adjust them for further tests.

### Settings:

<b>State</b>	.....	85
<b>Profile</b>	.....	85
<b>Speed</b>	.....	86
<b>D (min)</b>	.....	86
<b>D (S)</b>	.....	86
<b>K (Rician factor)</b>	.....	86
<b>Consider DL RF</b>	.....	86
<b>Start Offset</b>	.....	87
<b>Virtual DL RF</b>	.....	87

#### **State**

Activates/deactivates simulation of high-speed train propagation according to the selected scenario.

Remote command:

[\[:SOURce<hw>\] :FSIMulator:HSTRain:STATE on page 192](#)

#### **Profile**

Determines the fading profile for the selected scenario. The fading profile determines which transmission path is simulated.

Although both scenarios 1 and 3 are specified as pure Doppler paths without a fading profile and scenario 2 as a Rician fading, in this fading simulator you can change the fading profile.

"Static Path"      A static transmission path with no attenuation (loss) or delay is simulated.

"Pure Doppler"	A transmission path is simulated in which there is an individual direct connection from the transmitter to the moving receiver (discrete component). The simulated path has a constant delay and attenuation (no loss). The Doppler frequency shift is determined only by the parameters <b>Speed</b> , <b>D (min)</b> and <b>D (S)</b> .
	<b>Tip:</b> Use the SCPI command <a href="#">[:SOURce&lt;hw&gt;]:FSIMulator:HSTRain:FDOPpler?</a> to query the Doppler frequency shift.
"Rayleigh"	A radio hop is simulated in which many highly scattered subwaves arrive at a moving receiver.
"Rice"	One Rician fading propagation channel with <b>K (Rician factor)</b> and with one tap is simulated.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:HSTRain:PROFile](#) on page 190

### Speed

Sets the velocity parameter, i.e. the speed of the moving receiver.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:HSTRain:SPEed](#) on page 189

### D (min)

For "Profile > Static Path or Pure Doppler", sets the parameter  $D_{\text{min}}$  to define the distance between the BS and the railway track.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:HSTRain:DISTance:MINimum](#) on page 189

### D (S)

For "Profile > Static Path or Pure Doppler", sets the parameter  $D_S$  and define the initial distance  $D_S/2$  between the train and the BS at the beginning of the simulation.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:HSTRain:DISTance:STARt](#) on page 189

### K (Rician factor)

For scenario 2, sets the Rician factor K that is defined as the ratio between the dominant signal power and the variant of the other weaker signals.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:HSTRain:KFACTOR](#) on page 190

### Consider DL RF

Enables the selection of virtual downlink frequency (DL RF).

By default, this parameter is enabled for the HST (DL+UL) standards. For detailed description, see "[Doppler shift calculation](#)" on page 83.

**Note:** While performing HST BS tests and "Consider DL RF > Off", the DL Doppler shift is not considered by the calculation of the UL Doppler shift.

Remote command:

`[ :SOURce<hw> ] :FSIMulator:HSTRain:DOWNlink:FREQuency:STATE`  
on page 191

#### Start Offset

Set a value greater than zero to shift the HST profile in time.

Remote command:

`[ :SOURce<hw> ] :FSIMulator:HSTRain:SOFFSET` on page 191

#### Virtual DL RF

Sets the virtual downlink frequency. For HST BS tests, enter the  $F_{DL}$  defined in the specification. The value is used by the calculation of the UL Doppler shift.

For detailed description, see "Doppler shift calculation" on page 83

Remote command:

`[ :SOURce<hw> ] :FSIMulator:HSTRain:DOWNlink:FREQuency` on page 191

## 3.11 Custom fading profile

The custom fading profile requires R&S SMW-K72.

The custom fading profile allows you to modify the classical Jakes and Flat fading profiles. These modified profiles are required by the IEEE 802.11p channel models.

A frequency offset  $f_{offset}$  can be applied to shift the spectrum of the original profile. Two cut-off frequencies,  $f_l$  (lower) and  $f_u$  (upper), can be configured to set the lower and upper cut-off frequencies of the resulting spectrum, see Figure 3-10.

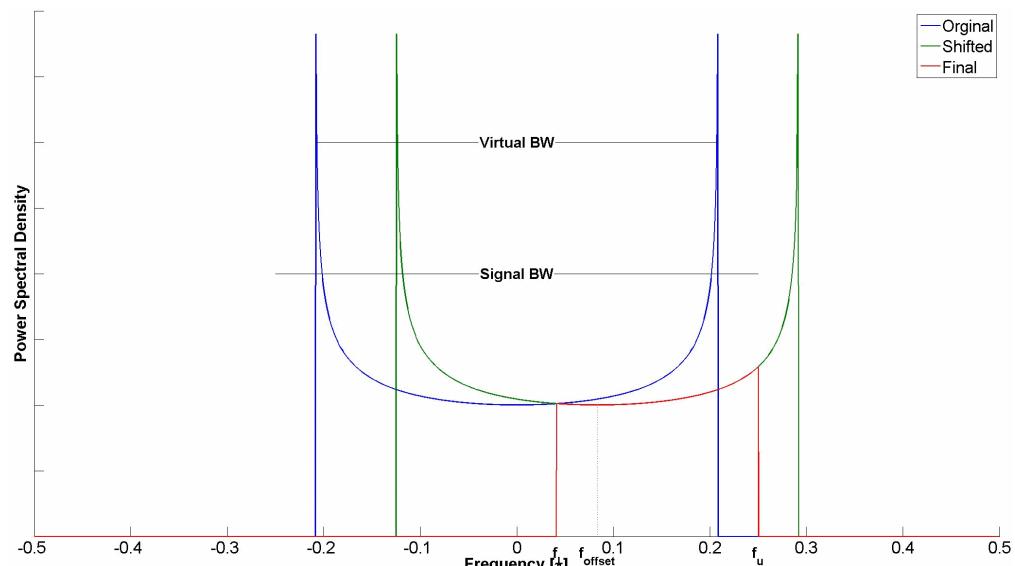

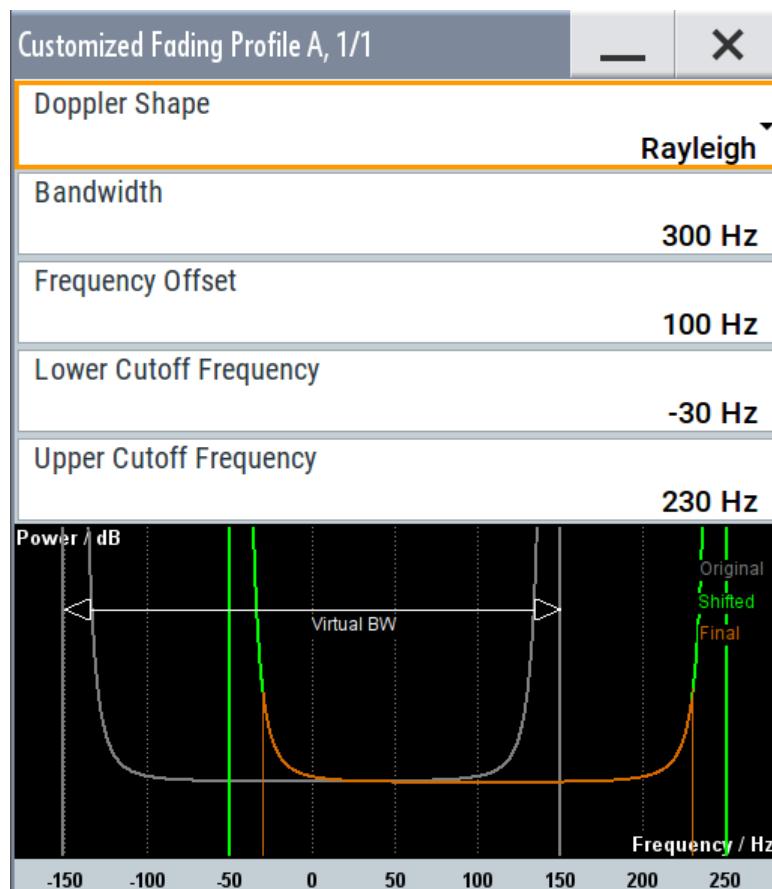

Figure 3-10: Resulting asymmetric Doppler spectrum

In the fading simulator, all these required profile parameters are configurable, see "Custom fading profile settings" on page 88.

### Custom fading profile settings

To access these settings:

1. Select "Fading > Fading Settings > Path Table"
2. Select "Profile > Custom"
3. Select "Custom Profile > Custom Data"

#### Settings:

Doppler Shape.....	88
Bandwidth.....	89
Frequency Offset.....	89
Lower/Upper Cutoff Frequency.....	89

#### Doppler Shape

Sets the Doppler shape ("Flat" or "Rayleigh") of the virtual profile.

Remote command:

```
[ :SOURce<hw> ] :FSIMulator:DELay|DEL:GROup<st>:PATH<ch>:CUSTom:  
DSHape on page 223
```

**Bandwidth**

Sets the bandwidth of the original Doppler profile from which the resulting profile is created, see [Figure 3-10](#).

Remote command:

[**:SOURce<hw>]:FSIMulator:DELay|DEL:GROup<st>:PATH<ch>:CUSTom:DATA** on page 223

**Frequency Offset**

Sets the frequency offset  $f_{\text{offset}}$  used to shift the original profile, see [Figure 3-10](#).

Remote command:

[**:SOURce<hw>]:FSIMulator:DELay|DEL:GROup<st>:PATH<ch>:CUSTom:DATA** on page 223

**Lower/Upper Cutoff Frequency**

Sets the lower and upper cut-off frequencies,  $f_l$  and  $f_u$ , that depend on the original profile bandwidth [Bandwidth](#).

The following applies:

- $f_u \leq f_{\text{offset}} + \text{Bandwidth}/2$
- $f_l \geq f_{\text{offset}} - \text{Bandwidth}/2$
- $f_u - f_l \geq 1 \text{ Hz}$
- $50 \text{ Hz} \leq \text{Bandwidth} \geq 40 \text{ kHz}$

Where the highest possible absolute cut-off frequency is 4 kHz.

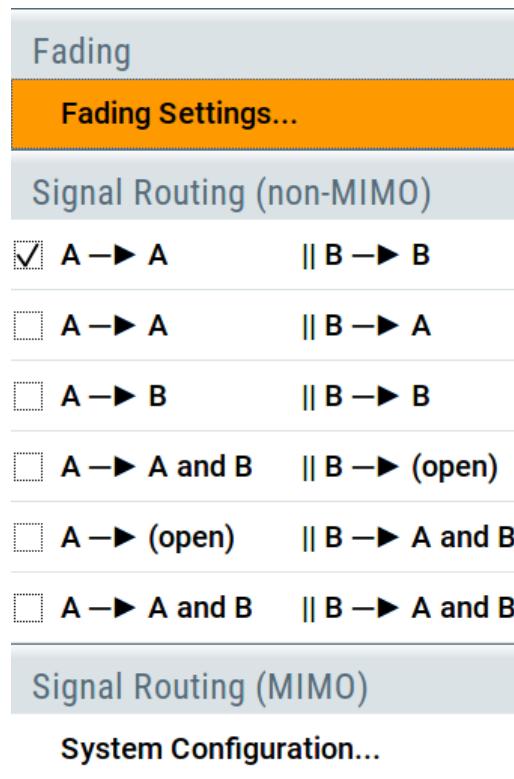

Remote command:

[**:SOURce<hw>]:FSIMulator:DELay|DEL:GROup<st>:PATH<ch>:CUSTom:DATA** on page 223

## 4 Signal routing settings

### To route the signal in standard (non-MIMO) configuration

1. Select "System Configuration > Mode > Standard".
2. Select "Fading > Signal Routing (non-MIMO)".

### To route the signal in MIMO configuration

Option: R&S SMW-B14/-B15/-K74 and optionally R&S SMW-K75/-K76

- Follow the instructions in [Chapter 5.2, "How to enable LxMxN MIMO test configurations"](#), on page 95.

### To generate SISO signal with 400 MHz or 800 MHz fading bandwidth

Option: R&S SMW-B15/-K822/-K823

- Select SISO configuration by following the instructions in:
  - ["To enable MIMO configuration with 400 MHz fading bandwidth"](#) on page 97.
  - ["To enable MIMO configuration with 800 MHz fading bandwidth"](#) on page 98.

This section describes the settings related to the fading bandwidth and simulation.

For comprehensive description of all settings in the "System Configuration" dialog and information on how to define the I/Q stream-mapping, connect external instruments, etc.:

See section "Signal routing and system configuration" in the R&S SMW user manual.

BB Bandwidth.....	91
CA Bandwidth.....	91
Signal Routing.....	91

### BB Bandwidth

Requires R&S SMW-B15/-K822/-K823.

Sets the baseband signal bandwidth that the fading simulator supports.

The value range and the maximum available bandwidth depend on the installed options and the selected MIMO configuration.

For example:

- In MIMO configurations with fewer than 8 channels, the max. baseband bandwidth is 400 MHz.
- In MIMO configurations with fewer than 4 channels, the max. baseband bandwidth is 800 MHz.

For more information, see data sheet.

Remote command:

[:SCONfiguration:BBBW](#) on page 240

### CA Bandwidth

Option: R&S SMW-B15/-K822/-K823

Indicates the resulting channel aggregation (CA) bandwidth, calculated based on the MIMO configuration and the "BB Bandwidth".

The "CA Bandwidth" represents the signal bandwidth at the stream mapper.

For more information, see data sheet.

Remote command:

[:SCONfiguration:CABW?](#) on page 241

### Signal Routing

In "System Configuration > Mode > Standard", defines the signal routing for the fading signal at the output of the fading simulator.

**Note:** Signal routing for MIMO setups is performed with the settings in the "System Configuration" dialog, see [Chapter 5.2, "How to enable LxMxN MIMO test configurations"](#), on page 95.

In remote control, however, all available signal routing settings are configured with the command [\[:SOURce<hw>\]:FSIMulator:ROUTE](#).

In "System Configuration > Mode > Standard", the input signal of the fading simulator is defined by the setting "Baseband > Signal Routing". An instrument equipped with two fading simulators and two baseband blocks, the input signal of each of the fading simulator can be:

- the signal from a single baseband block,
- the summation signal from both baseband blocks or
- each a signal from one of the two baseband blocks.

The following is a list of the routing settings for an instrument equipped with two baseband blocks, two signal paths and two options fading simulator (R&S SMW-B14).

- "A to A/ B to B"** Dual-channel fading. The fading signal from fader A is output on baseband path A and the fading signal from fader B is output on baseband path B.  
The R&S SMW can be operated like two instruments; two independently configured signals are routed to the instrument's output.  
This configuration is also suitable for transmit or receive diversity tests:
  - Use the signal of one of the baseband generators to simulate the receiving conditions of a receiver with two antennas, like a high-quality car radio or UMTS base station.
  - Correlate the paths of the two fading simulators, i.e. the two fading channels. You can simulate the conditions of receiver with two antennas which receive statistically correlated signals. Such condition appears, e.g., in a car with two antennas when the two received signals exhibit a degree of correlation due to a similar environment, like an underpass or hills.
- "A to A/B to A"** Dual-channel fading. The fading signal from fader A and the fading signal from fader B are both output on baseband path A.  
This configuration is suitable for the simulation of:
  - mobile radio network handover in the handheld device
  - testing of filtering out the own signal if there is simultaneous presence of a strong signal from another standard.To simulate the required conditions, configure each of the baseband signals according to the desired standard and route them to the fading simulator. After fading, the two signals with widely divergent signal strengths are output on a common output path.
- "A to B / B to B"**  
Dual-channel fading. The fading signal from fader A and the fading signal from fader B are both output on baseband path B.
- "A to A and B / B to A and B"**  
Dual-channel fading. The fading signal from fader A and the fading signal from fader B are output on baseband path A and baseband path B.  
The possible applications are analogous to the "A to A / B to A" routing. With this routing however, the signal at the output of the fading simulator is split up and routed to both paths. The processing of these two paths after the fading can be differently. To simulate a further degradation of the receiving conditions, for instance, use the provided function to superimpose the signal of one of the paths by noise or destroy it.
- "A to A and B / B (open)"**  
The fading signal from fader A is output on baseband path A and baseband path B. The signal from fader B is not output, the signal flow of baseband B is interrupted.

"A (open)/ B to A and B"

The fading signal from fader B is output on baseband path A and baseband path B. The signal from fader A is not output, the signal flow of baseband A is interrupted.

Remote command:

[**:SOURce<hw>**] :FSIMulator:ROUTE on page 156

## 5 Multiple input multiple output (MIMO)

If the instrument is equipped with the required options, the R&S SMW supports versatile MIMO configurations.

Section [Chapter 2.1, "Required options"](#), on page 18 provides an overview; for detailed information, refer to the R&S SMW data sheet.

Multiple input multiple output (MIMO) refers to a multi-channel method where two or more simultaneous channel inputs and channel outputs are being used for boosting data rates. The benefits of an MIMO system became visible only if the data signal is tested in fading conditions. The MIMO fading option considers this special form of multipath propagation in channel simulation.

Depending on the number of the transmitting and receiving antennas used in a MIMO system, different  $M \times N$  MIMO test configurations are specified. The term  $M \times N$  is a representation of a MIMO system, where  $M$  is the number of the transmitting Tx antennas and  $N$  the number of the receiving Rx antennas. Throughout this description, we also use the term  $L \times M \times N$  as a short form of the used system configuration. In this case,  $L$  represents the number of entities,  $M$  the number of basebands (Tx antennas) and  $N$  the number of streams (Rx antennas).

Normally, the simulation of a system with two or more transmitting and/or receiving antennas requires two or more signal generators and/or fading simulator. The MIMO fading option (R&S SMW-K74) in combination with up to four Fading simulator options (R&S SMW-B14) enables you to simulate MIMO receiver tests scenarios with up to 8 Tx or up to 8 Rx antennas with one single instrument. (See also [Chapter 5.1, "Multiple entity  \$M \times N\$  MIMO test configurations"](#), on page 95).

Configurations with more than two entities and the higher-order MIMO configurations require the additional options multiple entities (R&S SMW-K76) and higher order MIMO (R&S SMW-K75).

### Abstract representation of the signal routing

2x2 MIMO system	Preview diagram	Block diagram
Illustration of the principle	Detailed representation of the signal processing Each $F_{<Tx><Rx>}$ block represents one MIMO channel	"High level" representation The Fading simulator is displayed as one single block; the number of the input basebands ( $M$ ) and the output streams ( $N$ ) indicate the $M \times N$ MIMO configuration.

The representation of a multi-entity MIMO configuration is even more abstract (see also [Chapter 5.1, "Multiple entity MxN MIMO test configurations", on page 95](#)).

## 5.1 Multiple entity MxN MIMO test configurations

Equipped with the MIMO fading option (R&S SMW-K74), the instrument enables the simulation of versatile MIMO tests scenarios with one single instrument.

The supported MIMO scenarios depend on:

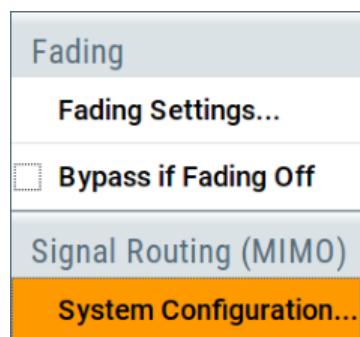

- The installed options, in particular on the number of options fading simulator (R&S SMW-B14/B15), i.e. on the number of the available [Fader] boards
- On the availability of the options multiple entities (R&S SMW-K76) and higher order MIMO (R&S SMW-K75).

For more information, see data sheet.

## 5.2 How to enable LxMxN MIMO test configurations

Option: R&S SMW-B14/-B15/-K74 and optionaly R&S SMW-K75/-K76

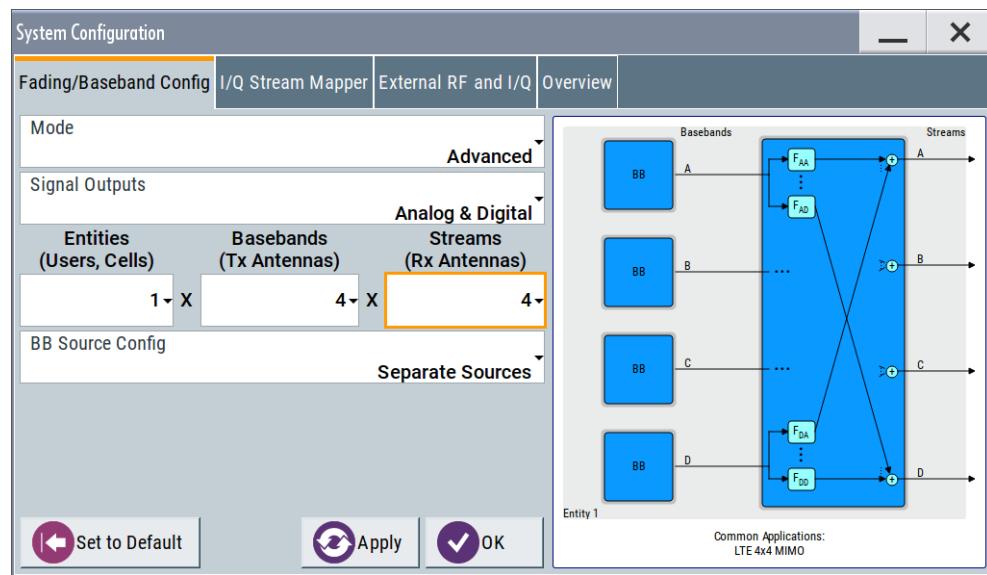

Select and configure a MIMO scenario before you define the further fading settings or the signal routing through the instrument.

### To enable a MIMO scenario

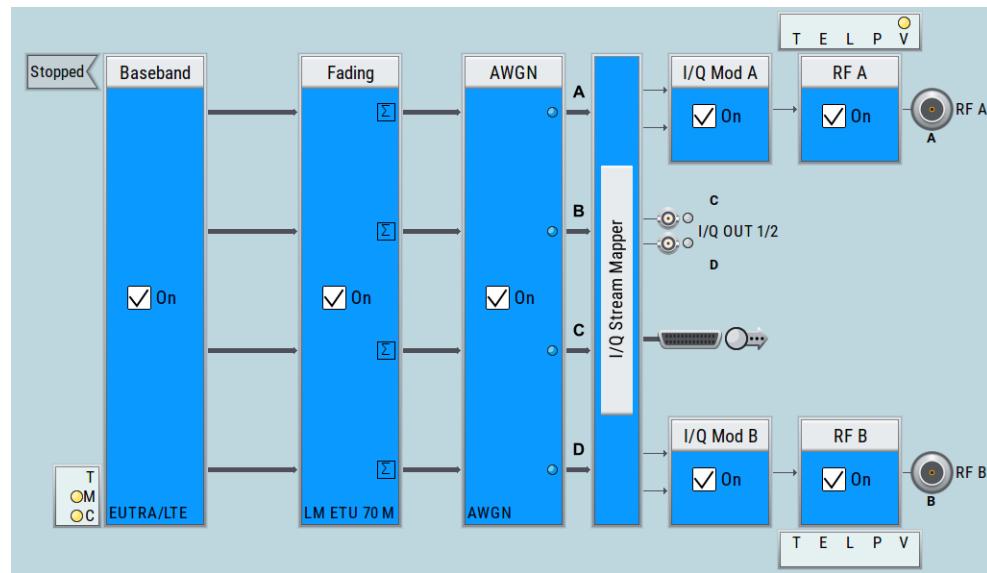

1. Select "Fading > MIMO > System Configuration"
2. In the "System Configuration > Fading/Baseband Configuration" dialog, enable "Mode > Advanced"
3. Define the MIMO scenario, e.g. to configure a 1x4x4 MIMO select:
  - a) "Entities (Users, Cells) = 1"
  - b) "Basebands (Rx Antennas) = 4"
  - c) "Streams (Tx Antennas) = 4"
  - d) "BB Source Config > Coupled Sources"

The preview diagram displays a detailed view of the signal routing for the current selected configuration, together with short description of the possible application of this configuration.

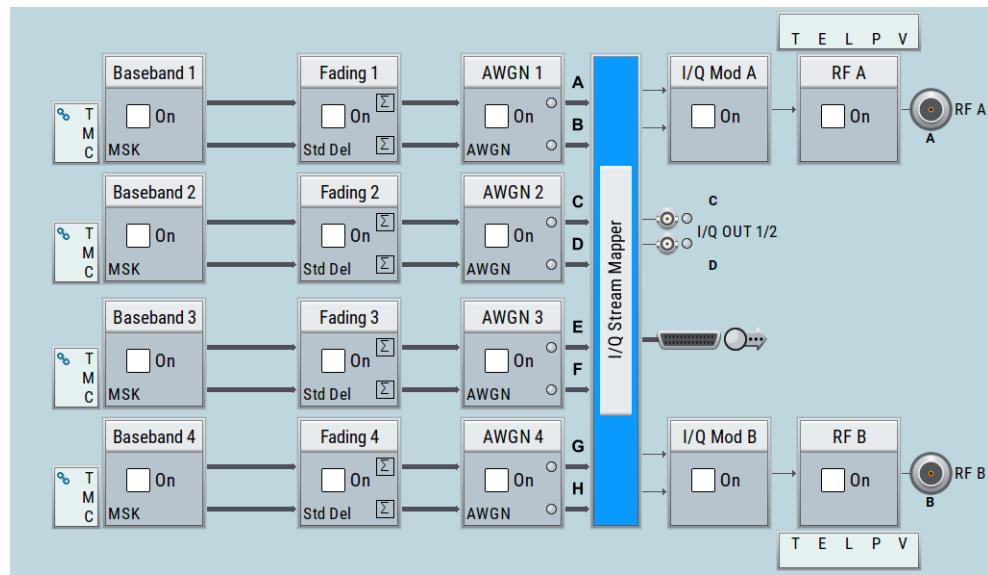

4. Select "Fading/Baseband Configuration > Apply" to trigger the instrument to use the selected configuration and close the dialog.

The block diagram displays the configured signal routing.

5. To enable a multiple-entities configuration, select "System Configuration > Fading/ Baseband Configuration" and enable for example:
  - "Mode > Advanced"
  - "Entities (Users, Cells) = 4", "Basebands (Rx Antennas) = 2", "Streams (Tx Antennas) = 2"
  - "BB Source Config > Coupled Sources per Entity"
  - "Apply".

Refer to [Chapter 5.3, "Fading settings in MIMO configuration", on page 98](#) for description on the provided MIMO fading settings.

#### To route the signal in MIMO mode

In MIMO mode, the signal routing is performed upon the selected MIMO configuration.

- ▶ Configure the instrument for a MIMO scenario.  
See "[To enable a MIMO scenario](#)" on page 95.

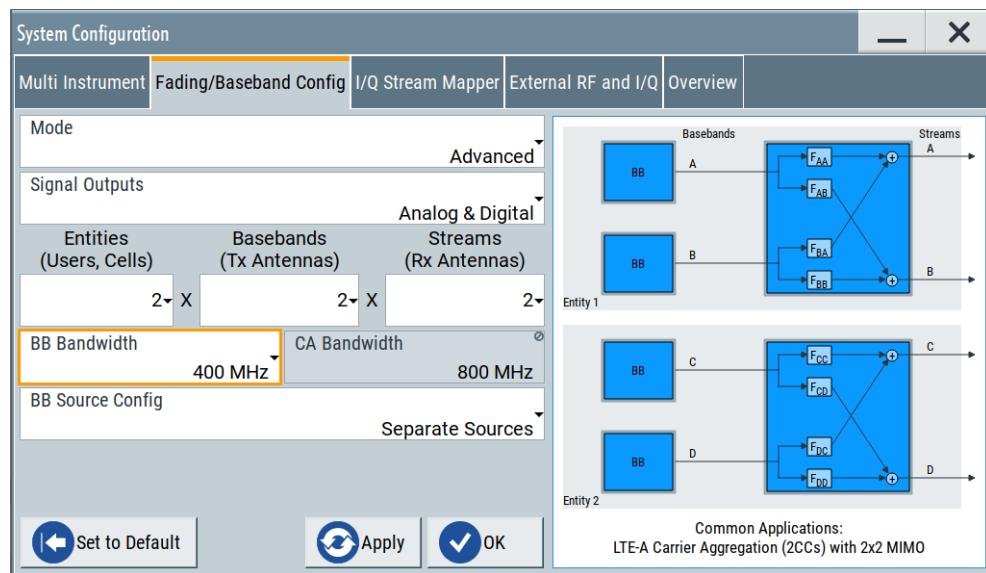

The signal routing is fixed and depends on the selected MIMO configuration.

#### To enable MIMO configuration with 400 MHz fading bandwidth

Option: R&S SMW-B15/-K74/-K822

1. Select "Fading > MIMO > System Configuration"
2. In the "System Configuration > Fading/Baseband Configuration" dialog, enable "Mode > Advanced"
3. Enable a MIMO scenario with up to 8 channels, e.g. 2x2x2 MIMO.
4. Select "BB Bandwidth = 400 MHz".

The parameter "CA Bandwidth" indicates the aggregated channel bandwidth at the stream mapper.

5. Select "Apply".
  6. Change the MIMO configuration, e.g. select 2x2x4 MIMO.  
The "BB Bandwidth" is set automatically to the maximum bandwidth for the selected MIMO configuration. The resulting "CA Bandwidth" is updated, too.
- To enable MIMO configuration with 800 MHz fading bandwidth**  
Option: R&S SMW-B15/-K74/-K822/-K823
1. Follow the instructions listed in "[To enable MIMO configuration with 400 MHz fading bandwidth](#)" on page 97.
  2. Enable a MIMO scenario with up to 4 channels, e.g. 1x2x2 MIMO.
  3. Select "BB Bandwidth = 800 MHz".
  4. Select "Apply".

## 5.3 Fading settings in MIMO configuration

The MIMO fading settings are available if a MIMO scenario is configured.

1. Configure the instrument for a MIMO scenario. See "[To enable a MIMO scenario](#)" on page 95.
2. You can access the dialog for configuring the MIMO settings of all MIMO channel via each of the "Fading" blocks.  
Select "Fading > Fading Settings".

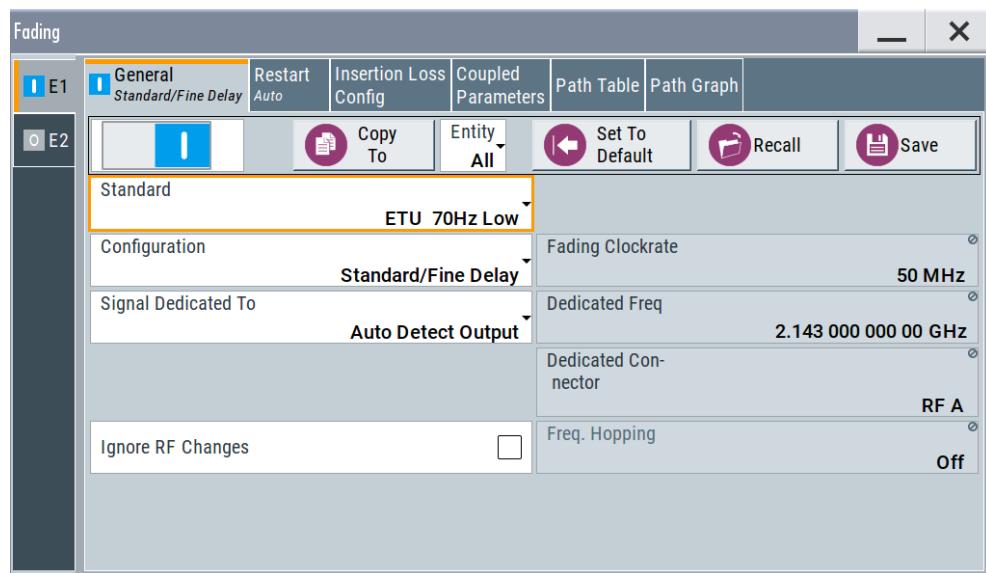

Figure 5-1: General settings in System Configuration > 2x2x2 (multi entity mode, L=2)

In "System Configurations" with multiple entities ( $L > 1$ ), the dialog consists of more than one side tabs; one tab per entity. The tab name indicates the fader state the settings are related to.

3. Select "Path Table".

		Copy Path Group		To		
		1	2		1	2
(Path) Group#	Unit	1 1a 1b	1 2	1 3...	2 1	2 2... 3 1...
State		On	On	Off	On	Off

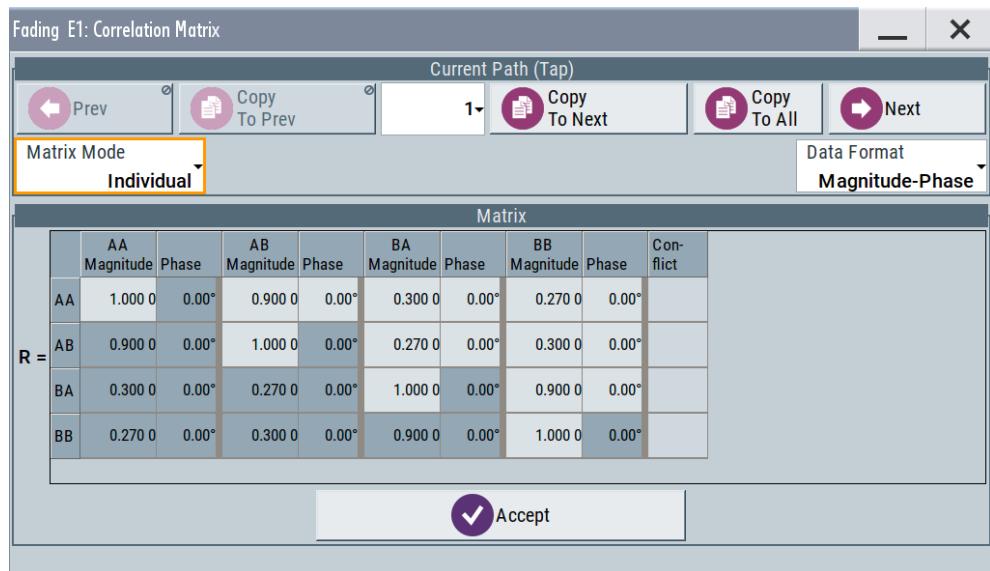

Figure 5-2: Path table settings in single entity mode (L=1): Understanding the displayed information

- 1a/1b = Path group number (displayed in the first row) and path number (second row in the table header); the example shows 4 groups with different number of active paths (the first group is marked with a blue border)
- 2 = Fading profile, assigned per fading path
- 3/3a = Common group delay of a path group ("Basic Delay" is always 0 for group 1); adjustable for the other groups (light gray background)
- 4 = Resulting delay per path, calculated as the sum of the common group delay and the path-specific delay.
- 5 = Adjustable parameter for paths with Rice fading
- 6 = Pure display parameters are on a dark background
- 7 = Access to a "Vector" or a "MIMO Matrix" for configuration of the correlation between the channels

4. In the path table, navigate to the row "Coefficient".  
For the corresponding path, select "Matrix" or "Vector".

The "Fading: Correlation Matrix" dialog comprises the parameters necessary to adjust the correlation between the channels. You can define the correlation in one of the following ways:

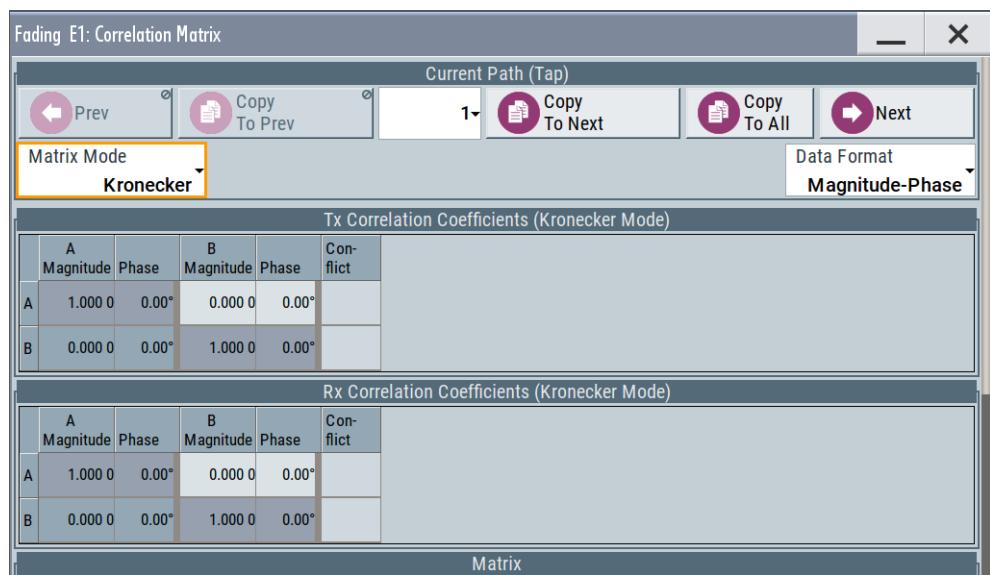

- In "Matrix Mode > Individual"

**Figure 5-3: Correlation matrix in an individual matrix mode**

In this mode, you can adjust the matrix coefficients directly in the coefficient matrix.

- In "Matrix Mode > Kronecker"

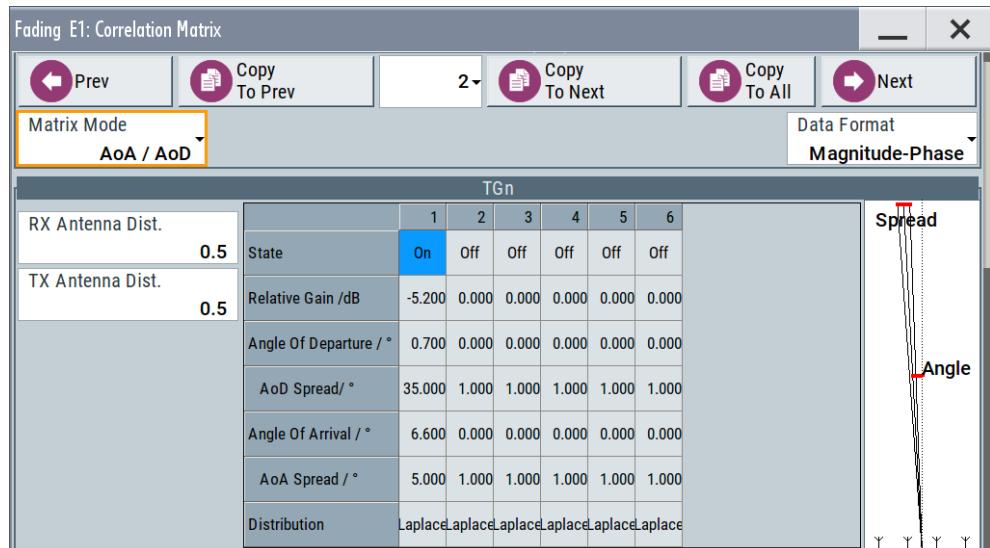

**Figure 5-4: Correlation matrix in the kronecker mode**

The definition of the correlation matrix settings is based on the kronecker assumption, i.e defined are the Rx and Tx antenna correlation coefficients. The instrument calculates automatically the resulting correlation matrix and displays it.

See [Chapter 5.3.4, "Kronecker mode correlation coefficients", on page 108](#).

- In "Matrix Mode > AoA/AoD"

**Figure 5-5: Correlation matrix in TGn format (AoA/AoD mode)**

See [Chapter 5.3.5, "TGn/TGac channel models settings", on page 110](#).

- In "Matrix Mode > SCME/WINNER"

Fading E1: Correlation Matrix

See:

- [Chapter 5.3.6, "SCME/WINNER model settings", on page 112](#)
- [Chapter 5.3.8, "MIMO OTA testing related settings", on page 130](#)
- For static paths and paths with "Pure Doppler" fading profile, the corresponding settings are grouped in the "Relative Tap Gain Vector" dialog.

Fading E1: Relative Tap Gain Vector (Pure Doppler)

Vector		
	Gain/dB	Phase/°
1 (AA)	0.00	0.00°
2 (AB)	-1.00	10.00°
3 (BA)	-2.00	0.00°
4 (BB)	-3.00	350.00°

Figure 5-6: Relative tap gain vector

This dialog provides additional parameters to simulate a gain weighting and phase shift between the signals with constant fading transmitted among the different Tx antennas.

See [Chapter 5.3.3, "Relative gain vector matrix settings", on page 106](#).

### 5.3.1 Current path (Tap) settings

#### Prev

Displays the previous tap relative to the current tap. If tap 1 is the current tap, this button is disabled.

Remote command:

n.a.

#### Copy To Prev

Copies the matrix values of the current tap to the next lower tap. If tap 1 is the current tap, this button is disabled.

Remote command:

[**:SOURce<hw>**] [:FSIMulator:MIMO:COPY:PREVIOUS on page 200

#### Current Path (Tap) #

Selects the tap to be displayed.

Remote command:

[**:SOURce<hw>**] [:FSIMulator:MIMO:TAP on page 200

#### Copy To Next

Copies the matrix values of the current tap to the next higher tap. If the current tap is the last tap, this button is disabled.

Remote command:

[**:SOURce<hw>**] [:FSIMulator:MIMO:COPY:NEXT on page 199

#### Copy To All

Copies the matrix values of the current tap all taps.

Remote command:

[**:SOURce<hw>**] [:FSIMulator:MIMO:COPY:ALL on page 199

#### Next

Displays the next tap relative to the current tap. If the current tap is the last tap, this button is disabled.

Remote command:

n.a.

#### Matrix Mode

Selects the input mode for the Rx and Tx correlation values.

"Individual"      Allows entering the correlation values individually.

"Kronecker"      Opens additional input fields for entering the Rx correlation and Tx correlation values, see [Chapter 5.3.4, "Kronecker mode correlation coefficients", on page 108](#).

The matrix values are calculated automatically.

"AoA / AoD"      Opens additional input fields for defining the Rx and TX correlation parameters based on the Spatial Channel Model (SCM), see [Chapter 5.3.5, "TGn/TGac channel models settings", on page 110](#).  
The matrix values are calculated automatically.

"SCME / WINNER"      Opens additional input fields for defining the parameters of the Spatial Channel Model Extended (SCME) model, see [Chapter 5.3.6, "SCME/WINNER model settings", on page 112](#).  
The matrix values are calculated automatically.

Remote command:

[ :SOURce<hw>] :FSIMulator:MIMO:TAP<ch>:MATRix:MODE on page 203

#### Polarization, Antenna Modeling

Accesses the corresponding tab in the "Antenna Model" dialog, see [Chapter 5.3.6, "SCME/WINNER model settings", on page 112](#).

#### Data Format

Selects the matrix representation format. The data format can be changed at every time. The matrix table is updated immediately.

"Magnitude-Phase"

Displays the matrix values as value pairs of magnitude and phase.

"Real-Imag"      Displays the matrix values as complex numbers.

Remote command:

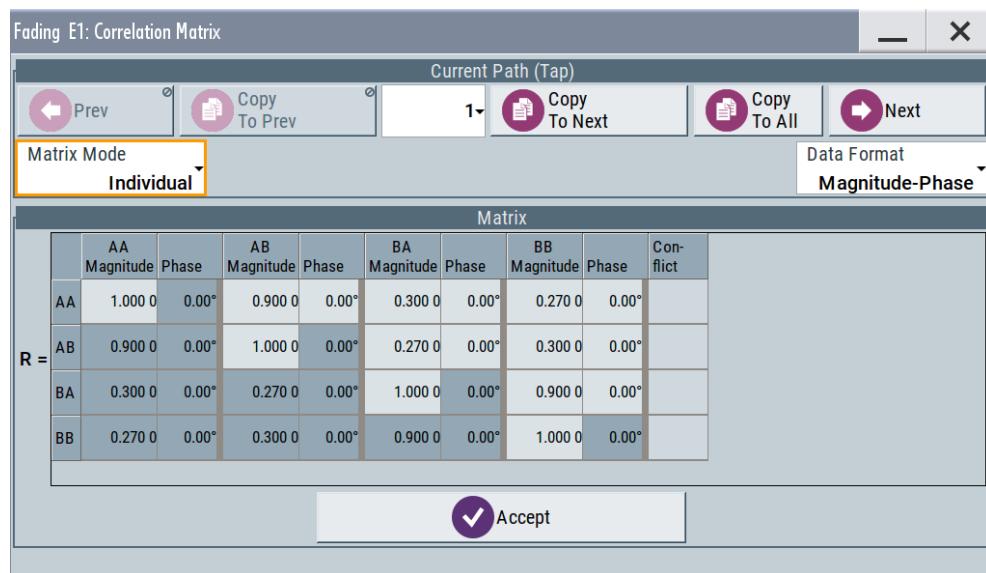

n.a.

### 5.3.2 Correlation matrix table

The correlation matrix table displays the values for the transmitter/receiver correlation. The correlation matrix is valid for the selected fading path. To adjust the values, edit the matrix elements directly, use the correlation coefficients of the Kronecker Mode, define the TGn/TGac parameters of the AoA /AoD mode or use the SCME/WINNER mode.

To access the settings of the correlation matrix in table form:

1. Enable a MIMO configuration
2. Select the "Fading > Path Table > Matrix" and navigate to "Fading: Correlation Matrix > Matrix".

### Defining the matrix values individually

In individual matrix mode, you have to define the matrix values manually. Irrespectively of the selected data format, you have to enter valid correlation values.

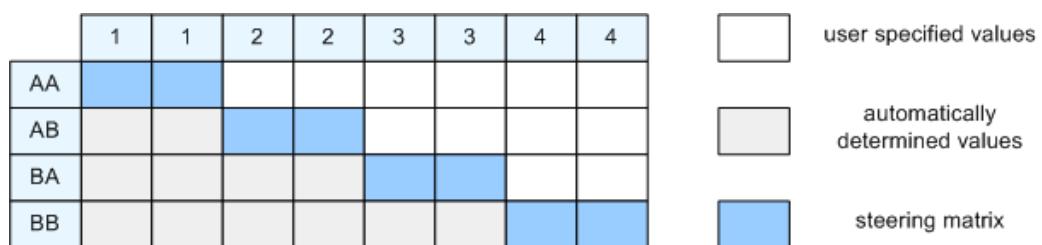

### Impossible calculation and conflict settings

The individual direct definition of the matrix elements may lead to impossible calculation due to inappropriate values and/or settings conflict.

You have to change the corresponding values.

The [Figure 5-7](#) uses a 2x2 MIMO matrix to depict the basic configuration principle.

*Figure 5-7: Simplified representation of a 2x2 MIMO matrix*

To define the matrix, set the only the value pairs in the diagonal and upper triangle (a total of 10 value pairs in this example, see [Figure 5-7](#)). The instrument exploits the complex conjugate symmetry across the diagonal and determines automatically the remaining value pairs in the lower triangle.

By default, the values in the matrix diagonal are set to 1. Use values different than 1 to simulate antennas with different power level (steering).

**Settings:**

Real/Magnitude.....	106
Phase/Imag.....	106
Conflict.....	106
Accept.....	106

**Real/Magnitude**

Enters the value for the real/ratio part of the correlation.

Remote command:

[**:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:MATRix:ROW<di>:COLumn<st>:  
MAGNitude** on page 204

**Phase/Imag**

Enters the value for the phase/imaginary part of the correlation.

Remote command:

[**:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:MATRix:ROW<di>:COLumn<st>:  
PHASE** on page 203

**Conflict**

Indicates a matrix conflict.

Remote command:

[**:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:MATRix:CONFLICT?** on page 203

**Accept**

Accepts the values for the phase/imaginary and the real/ratior part of the correlation.

Remote command:

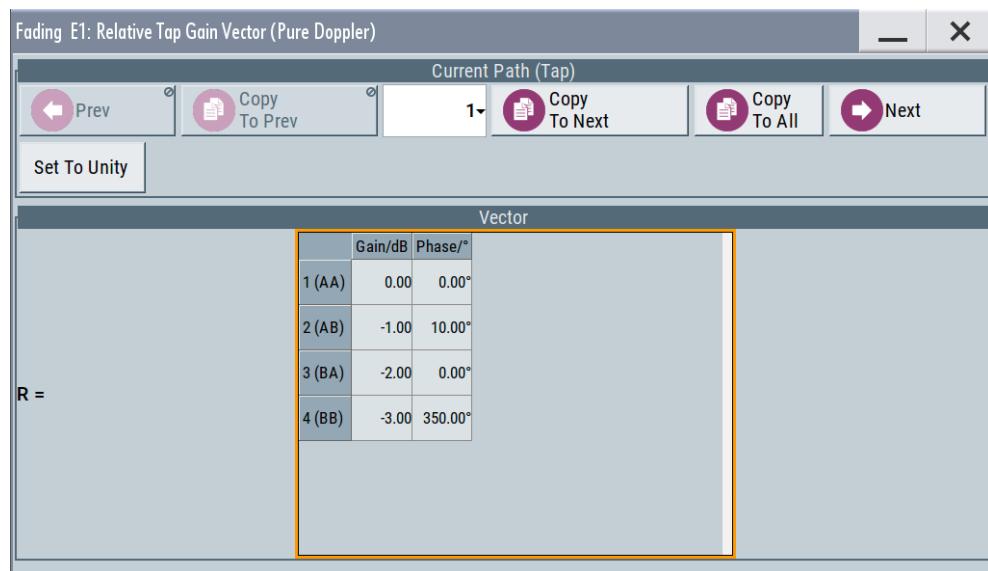

[**:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:MATRix:ACCEpt** on page 202

### 5.3.3 Relative gain vector matrix settings

The "Fading: Relative Tap Gain Vector" dialog is available for static paths and paths with "Pure Doppler Fading Profile". This dialog provides additional parameters to simulate a gain weighting or phase shift between the signals with constant fading transmitted over the different Tx antennas.

Access:

1. Enable a MIMO configuration and select "Fading > Path Table > Profile > Static or Pure Doppler".
2. Select "Path Table > Coefficient > Vector".

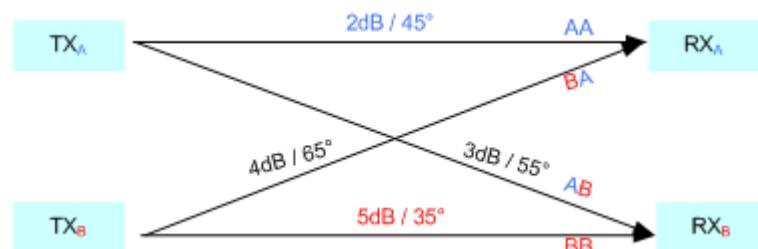

Use this function to simulate beamforming signal.

## Example:

This example illustrates the phase shift between the signals with a start phase of 45 degrees, power level of 2 dB, and the gain and phase settings as follow:

- "AA Gain > 0", "AA Phase > 0"
  - "AB Gain > -1", "AB Phase > 10"
  - "BA Gain > -2", "BA Phase > 20"
  - "BB Gain > -3", "BB Phase > 350"

### Resulting simulation:

## Settings:

<a href="#">Set to Unity</a>	107
<a href="#">Gain</a>	108
<a href="#">Phase</a>	108

## **Set to Unity**

**Unitary** Presets the vector matrix to an unitary matrix.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:MIMO:TAP<ch>:GVECtor:PRESet on page 204](#)

### Gain

(disabled if customized dynamic fading R&S SMW-K820 is used)

Defines the relative gain of the selected path.

A gain value of 0 dB means no loss, and e.g. -3 dB is loss in this path.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:MIMO:TAP<ch>:GVECtor<st>:GAIN on page 204](#)

### Phase

Defines the phase shift of the selected path.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:MIMO:TAP<ch>:GVECtor<st>:PHASE on page 205](#)

## 5.3.4 Kronecker mode correlation coefficients

- ▶ To access the settings of the correlation matrix in Kronecker mode, enable a MIMO configuration, select the "Fading > Path Table > Matrix" and select "Fading: Correlation Matrix > Matrix Mode > Kronecker".

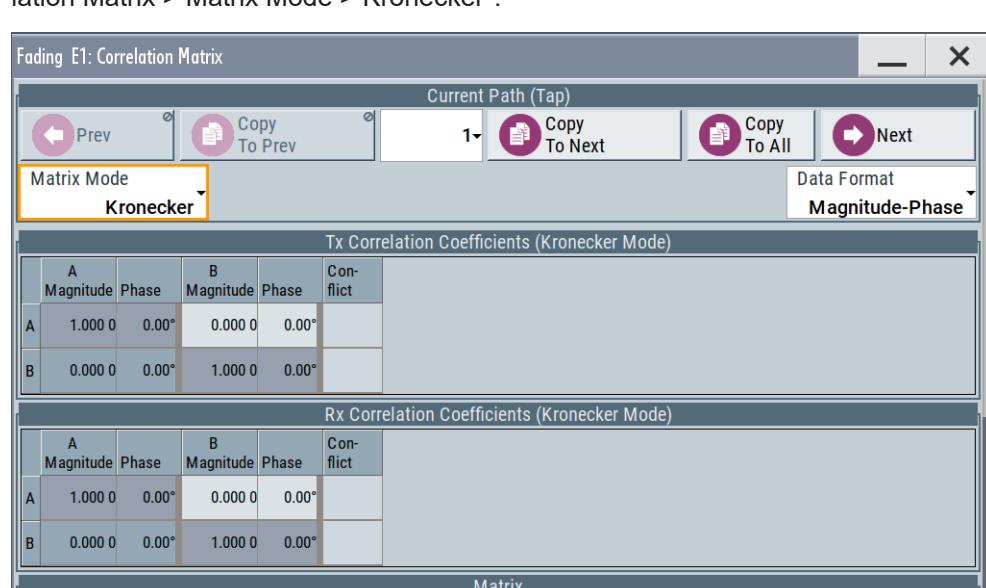

Figure 5-8: Correlation matrix in Kronecker mode

### Calculating of the matrix values based on the Kronecker assumption

In Kronecker mode, it is sufficient that you specify one Tx and one Rx correlation per MIMO channel. The instrument automatically computes the full correlation matrix according to the formula:

$$R_l = R_{\text{Tx}}^{(l)} \otimes R_{\text{Rx}}^{(l)}, \text{ where } R_{\text{Tx}}^{(l)} = \begin{bmatrix} 1 & \rho_{\text{Tx}}^{(l)} \\ \rho_{\text{Tx}}^{(l)*} & 1 \end{bmatrix} \text{ and } R_{\text{Rx}}^{(l)} = \begin{bmatrix} 1 & \rho_{\text{Rx}}^{(l)} \\ \rho_{\text{Rx}}^{(l)*} & 1 \end{bmatrix}$$

where  $\rho_{\text{Rx}}^{(l)}$  and  $\rho_{\text{Tx}}^{(l)}$  are the Rx and Tx correlations.

The evaluation of the Kronecker product  $\otimes$  leads to:

$$R_l = \begin{bmatrix} 1 & \rho_{\text{Rx}}^{(l)} & \rho_{\text{Tx}}^{(l)} & \rho_{\text{Tx}}^{(l)}\rho_{\text{Rx}}^{(l)} \\ \rho_{\text{Rx}}^{(l)*} & 1 & \rho_{\text{Tx}}^{(l)}\rho_{\text{Rx}}^{(l)*} & \rho_{\text{Tx}}^{(l)} \\ \rho_{\text{Tx}}^{(l)*} & \rho_{\text{Tx}}^{(l)*}\rho_{\text{Rx}}^{(l)} & 1 & \rho_{\text{Rx}}^{(l)} \\ \rho_{\text{Tx}}^{(l)}\rho_{\text{Rx}}^{(l)*} & \rho_{\text{Tx}}^{(l)*} & \rho_{\text{Rx}}^{(l)*} & 1 \end{bmatrix}$$

Which and how many coefficients are available, depends on the selected MIMO configuration, e.g. any of the 2x2, 4x2, and 3x2 MIMO configurations, requires only one Rx correlation coefficient AB, whereas there are six Rx correlation coefficients in case of 2x4 MIMO configuration.

### Settings:

Tx Correlation Coefficients, Magnitude/Real.....	109
Tx Correlation Coefficients, Phase/Imag.....	109
Rx Correlation Coefficients, Magnitude/Real.....	110
Rx Correlation Coefficients, Phase/Imag.....	110

#### Tx Correlation Coefficients, Magnitude/Real

Enters the value for the real/ratio part of the transmitter correlation ( $\rho_{\text{Tx}}^{(l)}$ ).

The available Tx correlation coefficients depends on the selected MIMO mode.

Remote command:

For "Data Format > Magnitude-Phase"

`[ :SOURce<hw> ] :FSIMulator:MIMO:TAP<ch>:KRONecker:CORRelation:TX:ROW<di>:COLumn<st>:MAGNitude` on page 202

For "Data Format > Real-Imag"

`[ :SOURce<hw> ] :FSIMulator:MIMO:TAP<ch>:KRONecker:CORRelation:TX:ROW<di>:COLumn<st>:REAL` on page 202

#### Tx Correlation Coefficients, Phase/Imag

Enters the value for the phase/imaginary part of the transmitter correlation ( $\rho_{\text{Tx}}^{(l)}$ ).

The available Tx correlation coefficients depends on the selected MIMO mode.

Remote command:

For "Data Format > Ratio-Phase"

`[ :SOURce<hw> ] :FSIMulator:MIMO:TAP<ch>:KRONecker:CORRelation:TX:ROW<di>:COLumn<st>:PHASE` on page 201

For "Data Format > Real-Imag"

[**:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:KRONecker:CORrelation:TX:ROW<di>:COLumn<st>:IMAGinary** on page 201

#### Rx Correlation Coefficients, Magnitude/Real

Enters the value for the real/ratio part of the receiver correlation ( $\rho^{(l)}_{Rx}$ ).

The available Rx correlation coefficients depends on the selected MIMO mode.

Remote command:

For "Data Format > Magnitude-Phase"

[**:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:KRONecker:CORrelation:RX:ROW<di>:COLumn<st>:MAGNitude** on page 202

For "Data Format > Real-Imag"

[**:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:KRONecker:CORrelation:RX:ROW<di>:COLumn<st>:REAL** on page 202

#### Rx Correlation Coefficients, Phase/Imag

Enters the value for the phase/imaginary part of receiver correlation ( $\rho^{(l)}_{Rx}$ ).

The available Rx correlation coefficients depends on the selected MIMO mode.

Remote command:

For "Data Format > Ratio-Phase"

[**:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:KRONecker:CORrelation:RX:ROW<di>:COLumn<st>:PHASe** on page 201

For "Data Format > Real-Imag"

[**:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:KRONecker:CORrelation:RX:ROW<di>:COLumn<st>:IMAGinary** on page 201

### 5.3.5 TGn/TGac channel models settings

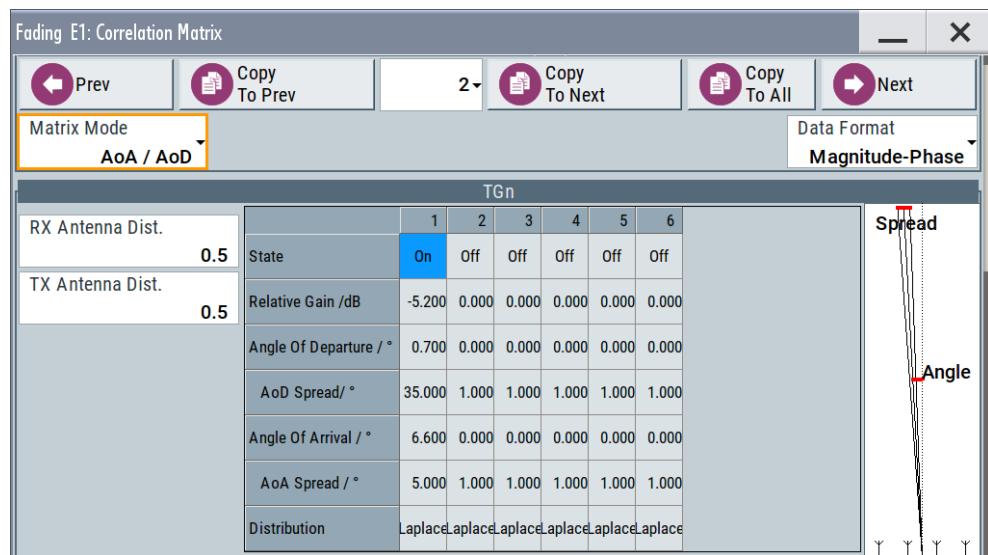

TGn and TGac channel models are specified for the evaluation of IEEE 802.11n and IEEE 802.11ac systems respectively.

These channel models are based on the so called rays, which are defined at the BS and MS side by their AoA (Angle of Arrival) and the AoD (Angle of Departure). The rays are distributed according to the selected statistic function and angle spread (AS).

In this implementation, one fading path consists by default of one ray but you can define up to six rays per path. The AoA (Angle of Arrival) / AoD (Angle of Departure) parameters, i.e. AoA/AoD angles, angle spreads (AS) and distribution of the rays, as well as the distances between the antennas at the Tx and the Rx side, are configurable.

#### To access the dialog with TGn/TGac settings

1. Enable a MIMO configuration, select the "Fading > Path Table > Matrix".
2. Select "Fading: Correlation Matrix > Matrix Mode > AoA/AoD".

### Settings:

<a href="#">RX/TX Antenna Distance</a>	111
<a href="#">Ray State</a>	111
<a href="#">Relative Gain /dB</a>	111
<a href="#">Angle of Arrival (AoA)</a>	112
<a href="#">AoA Spread</a>	112
<a href="#">Angle of Departure (AoD)</a>	112
<a href="#">AoD Spread</a>	112
<a href="#">Distribution</a>	112

### RX/TX Antenna Distance

Determines the distance between the Tx and Rx antennas as function of the wave length lambda and is calculated as follow:

*Physical Antenna Distance = "RX/TX Antenna Distance" \*  $\lambda$ , where*

*the wave length  $\lambda = c / \text{Frequency}$  and c is the speed of light.*

Remote command:

[\[:SOURce<hw>\]:FSIMulator:MIMO:TGN:ANTenna:DISTance:RX](#) on page 206  
[\[:SOURce<hw>\]:FSIMulator:MIMO:TGN:ANTenna:DISTance:TX](#) on page 206

### Ray State

Enables/disables the selected ray.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:MIMO:TAP<ch>:TGN:RAY<st>:STATE](#)  
on page 208

### Relative Gain /dB

Sets the relative gain (in dB) of the selected ray.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:MIMO:TAP<ch>:TGN:RAY<st>:GAIN](#) on page 207

**Angle of Arrival (AoA)**

Sets the AoA (Angle of Arrival) of the selected ray.

Remote command:

[**:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:TGN:RAY<st>:ARRival:ANGLE**  
on page 207

**AoA Spread**

Sets the AoA (Angle of Arrival) spread (AS) of the selected ray.

Remote command:

[**:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:TGN:RAY<st>:ARRival:SPRead**  
on page 207

**Angle of Departure (AoD)**

Sets the AoD (Angle of Departure) of the selected ray.

Remote command:

[**:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:TGN:RAY<st>:DEParture:ANGLE**  
on page 207

**AoD Spread**

Sets the AoD (Angle of Departure) spread (AS) of the selected ray.

Remote command:

[**:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:TGN:RAY<st>:DEParture:SPRead**  
on page 207

**Distribution**

Select one of the proposed statistical functions to determine the distribution of the selected ray.

**Tip:** Use this parameter to simulate ray scattering due to obstacles with different surface (see also [Chapter 6.7, "TGn settings", on page 205](#)).

Remote command:

[**:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:TGN:DISTribution** on page 206

### 5.3.6 SCME/WINNER model settings

Option: R&S SMW-K72/-K73

The SCME and WINNER II channel models are developed by WINNER [1]. The original model is the SCM (Spatial Channel Model) and the SCME (SCM Extension) is its first extension. The WINNER II is the final published model.

The SCME and WINNER II channel models offer Cluster Delay Line (CDL) models for reduced complexity simulations. These CDL models can be simulated in the SCME/WINNER matrix mode. A channel correlation matrix is calculated from the CDL parameters and the channel is stochastically simulated.

This section describes the settings of the SCME/WINNER model. For information on the antenna modeling and polarization, see:

- [Chapter 5.3.8, "MIMO OTA testing related settings", on page 130](#).

- See also [Chapter A.16, "SCM and SCME channel models for MIMO OTA"](#), on page 308.

Access:

1. Enable a MIMO configuration.  
See "[To enable a MIMO scenario](#)" on page 95.
2. Select "Fading > Path Table > Matrix"
3. In the required "Tap", select "Fading: Correlation Matrix > Matrix Mode > SCME / WINNER"

SCME / WINNER														
Cluster	1			2			3			4			5	
State	On				On			On			Off		Off	
Relative Gain /dB	0.000				-1.300			-2.700			0.000		0.000	
Sub-Cluster	1	2	3	1	2	3	1	2	3	1	2	3	1	2
State	On	Off	Off	Off	Off	Off								
Relative Gain /dB	-3.010	-5.229	-6.990	-4.310	-6.529	-8.290	-5.710	-7.929	-9.690	0.000	0.000	0.000	0.000	0.000
Angle Of Departure / °	6.600			14.100			0.000			0.000			0.000	
AoD Spread/ °	5.000			1.000			1.000			1.000			1.000	
Angle Of Arrival / °	0.000			0.000			0.000			0.000			0.000	
AoA Spread / °	25.000			25.000			25.000			1.000			1.000	
Distribution	Equal			Equal			Equal			Equal			Equal	

With the provided settings, you can define up to 20 clusters, each of which comprising of up to 3 subclusters.

A cluster is defined with its AoA (Angle of Arrival) / AoD (Angle of Departure) parameters. These are the AoA/AoD angles, angle spreads (AS) and a relative gain. If a subcluster is enabled, it is also attenuated. The three subclusters powers are fixed ratios of the total cluster power (see [Subcluster > Relative Gain /dB](#))

Different Power Azimuth Spectrum (PAS) distributions can be used to describe the distribution of the selected cluster. However, usually the clusters simulated in one path have the same distribution.

#### Settings:

MS Speed.....	114
MS DoT (Direction of Travel).....	114
Cluster State.....	114
Relative Gain /dB.....	114
Subcluster > State.....	114
Subcluster > Relative Gain /dB.....	114

Angle of Departure (AoD).....	115
AoD Spread.....	115
Angle of Arrival (AoA).....	115
AoA Spread.....	115
Distribution.....	115

**MS Speed**

Sets the speed of the mobile station.

This value determines the value of the parameter "Speed" (see Path Table > [Speed](#)).

Remote command:

[ :SOURce<hw> ] :FSIMulator:MIMO:SCWI:TAP<st>:SPeed on page 211

**MS DoT (Direction of Travel)**

Sets the direction of travel of the mobile station.

If LOS (line-of-sight) is simulated, then this parameter sets the value of the parameter [Frequency Ratio](#) for the Rice fading profile.

Remote command:

[ :SOURce<hw> ] :FSIMulator:MIMO:SCWI:TAP<st>:DOT on page 211

**Cluster State**

Enables/disables the selected cluster.

Remote command:

[ :SOURce<hw> ] :FSIMulator:MIMO:SCWI:CLUSTER<ch>:TAP<st>:STATE on page 211

**Relative Gain /dB**

Sets the relative gain (in dB) of the selected cluster.

Remote command:

[ :SOURce<hw> ] :FSIMulator:MIMO:SCWI:CLUSTER<ch>:GAIN on page 211

**Subcluster > State**

If the corresponding cluster is enabled, you can enable up to 3 subclusters.

A cluster is composed of 20 spatially separated subpaths with equal powers. The subpaths are occasionally split to subsets or subclusters (also known as mid-paths) having different resolvable delays. In the SCME and WINNER II models, one cluster can be split into 3 subclusters. Each subcluster consists of 10, 6 and 4 subpaths. Hence, the subcluster power is 10/20, 6/20 and 4/20 relative power to the total cluster power.

See also "[Relative Gain /dB](#)" on page 114.

Remote command:

[ :SOURce<hw> ] :FSIMulator:MIMO:SCWI:CLUSTER<ch>:TAP<st>:SUBCLUSTER<di>:STATE on page 213

**Subcluster > Relative Gain /dB**

Displays the resulting relative attenuation, applied on an enabled subcluster. The value is determined based on the select "Relative Gain" of the cluster and is calculated as follows:

$$\text{RelativeGain}_{\text{Sub-Cluster}} = \text{RelativeGain}_{\text{Cluster}} + \text{GainFactor}$$

The used gain factors are values in dB and are listed in [Table 5-1](#).

The values are part of the SCME Urban Micro-Cell (SCME UMi) and SCME Urban Macro-Cell (SCME UMa) models according to [TR 37.977](#).

*Table 5-1: Overview: Gain factors and default relative gain values per subcluster*

Sub-Cluster number	Gain Factor, W	Gain Factor, dB
1	10/20	-3.01
2	6/20	-5.229
3	4/20	-6.99

Remote command:

[**:SOURce<hw>]:FSIMulator:MIMO:SCWI:CLUSTER<ch>:TAP<st>:  
SUBCluster<di>:GAIN?** on page 213

### Angle of Departure (AoD)

Sets the AoD (Angle of Departure) of the selected cluster.

Remote command:

[**:SOURce<hw>]:FSIMulator:MIMO:SCWI:CLUSTER<ch>:DEParture:ANGLE**  
on page 212

### AoD Spread

Sets the AoD (Angle of Departure) spread (AS) of the selected cluster.

Remote command:

[**:SOURce<hw>]:FSIMulator:MIMO:SCWI:CLUSTER<ch>:DEParture:SPRead**  
on page 212

### Angle of Arrival (AoA)

Sets the AoA (Angle of Arrival) of the selected cluster.

Remote command:

[**:SOURce<hw>]:FSIMulator:MIMO:SCWI:CLUSTER<ch>:ARRival:ANGLE**  
on page 212

### AoA Spread

Sets the AoA (Angle of Arrival) spread (AS) of the selected cluster.

Remote command:

[**:SOURce<hw>]:FSIMulator:MIMO:SCWI:CLUSTER<ch>:ARRival:SPRead**  
on page 212

### Distribution

To set the distribution of the selected cluster, select one of the power azimuth spectrum (PAS) distributions. All clusters of the same tap must have the same distribution.

**Tip:** Use this parameter to simulate rays scattered due to obstacles with different surface (see also [Chapter 6.7, "TGn settings", on page 205](#)).

Remote command:

```
[:SOURce<hw>]:FSIMulator:MIMO:SCWI:CLUSTER<ch>:DISTribution
on page 212
```

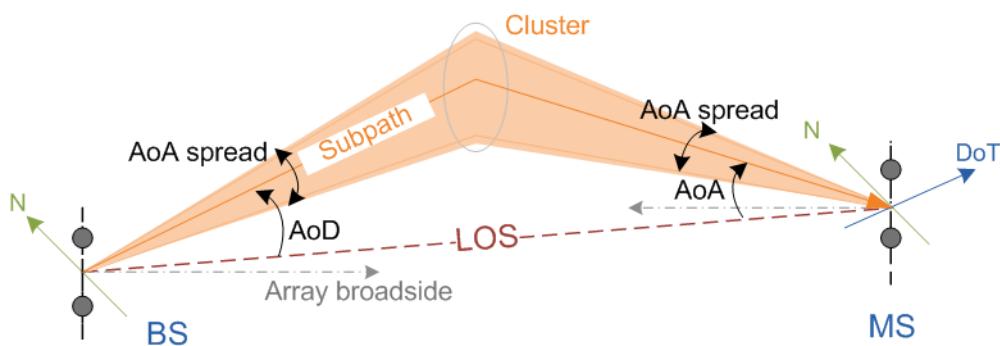

### 5.3.7 SCM fading profile

Option: R&S SMW-K73

#### Spatial channel model (SCM)

The spatial channel model (SCM) is a 2D geometry-based channel model specified in the 3GPP [TR 25.996](#).

In the SCM fading profile, the channel coefficients are not calculated from a MIMO correlation matrix but given by an equation. This equation depends on geometrical parameters, like the angle of arrival and departure, and angular spread and their statistical behavior. The illustration on [Figure 5-9](#) outlines the main SCM parameters. For detailed description of the SCM model, see [TR 25.996](#).

*Figure 5-9: SCM angular parameters (simplified representation)*

BS	= Base station antenna array
MS	= Mobile station antenna array
N	= North: absolute reference direction used to define the antenna orientation (array broadside)
DoT	= Direction of travel of the mobile station
LOS	= Line-of-sight
AoD	= Angle of departure
AoA	= Angle of arrival
Cluster	= Group of 20 spatially separated subpaths with equal powers; one cluster can be split into three subclusters, where the subclusters consist of 10, 6 and 4 subpaths.

#### 3D geometry-based channel model

The 3D geometry-based channel model is specified in the 3GPP [TR 36.873](#).

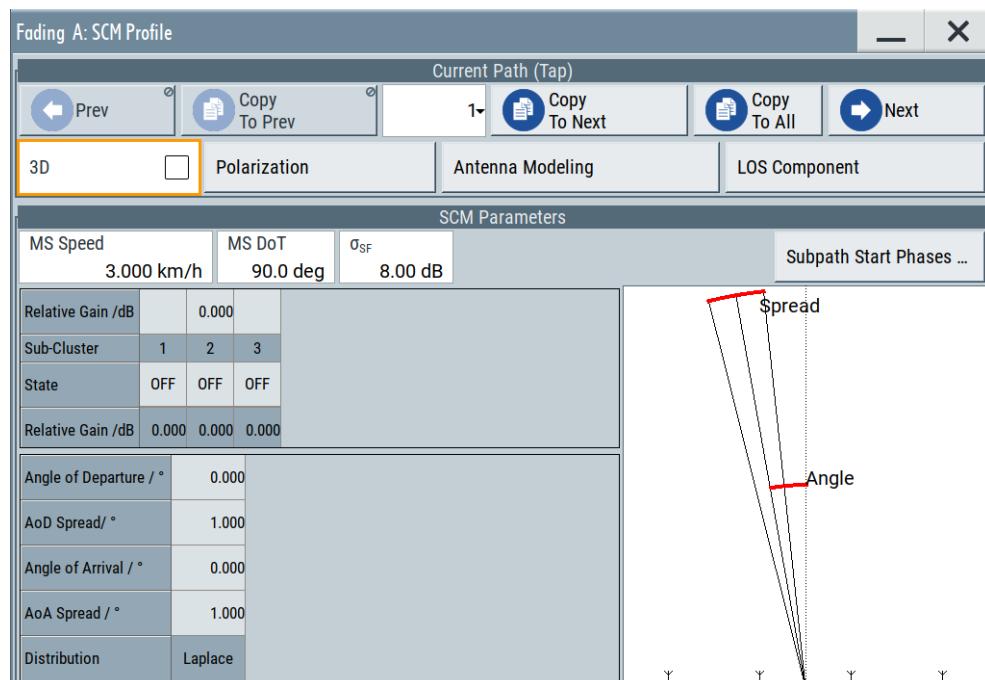

The model is an extension to the 2D spatial channel model (SCM). The following additional parameters are provided:

- Zenith of Departure/Arrival
- Zenith angular spread for Departure/Arrival
- DoT (direction of travel)

- Antenna array configurations comprising row and column number larger or equal to one (see [Chapter 5.3.7.4, "Antenna modeling settings", on page 122](#))
- Additional antenna pattern files for 3D, based on the predefined antenna patterns files for the 2D model (see ["Antenna Pattern" on page 125](#))

**Access:**

1. Enable a MIMO configuration.  
See ["To enable a MIMO scenario" on page 95](#).
2. Select "Fading > Path Table > Path# > Profile > SCM".
3. Select "SCM Profile > SCM Data".

The provided parameters are similar to the parameters in SCME/WINNER matrix mode, like the angle, channel polarization and antenna modeling settings provided for MIMO-OTA testing. You can configure one SCM cluster per fading path but the channel and antenna parameters are common for all paths.

For background information on the antenna modeling and channel polarization, see:

- ["Antenna Modeling" on page 132](#)
- ["Channel polarization" on page 133](#)

- [SCM cluster settings](#)..... 118
- [3D channel model](#)..... 120
- [Channel polarization settings](#)..... 121
- [Antenna modeling settings](#)..... 122
- [LOS component settings](#)..... 126
- [Subpath start phases](#)..... 128

Subcluster > Relative Gain /dB.....	119
Angle of Departure (AoD).....	119
AoD Spread.....	119
Angle of Arrival (AoA).....	119
AoA Spread.....	119
Distribution.....	119

#### MS Speed

Sets the speed of the mobile station.

This value determines the value of the parameter "Speed" (see "Path Table" > [Speed](#)).

Remote command:

[[:SOURce<hw> :FSIMulator:SCM:SPeed](#) on page 227]

#### MS DoT (Direction of Travel)

Sets the direction of travel of the mobile station, see [Figure 5-9](#).

Remote command:

[[:SOURce<hw> :FSIMulator:SCM:DOT](#) on page 228]

#### $\sigma_{SF}$

Sets the lognormal shadow fading standard deviation, applied as a common parameter to the paths.

Remote command:

[[:SOURce<hw> :FSIMulator:SCM:SIGMa](#) on page 228]

#### Relative Gain /dB

Sets the relative gain (in dB) of the selected cluster.

Remote command:

[[:SOURce<hw> :FSIMulator:SCM:TAP<st>:GAIN](#) on page 230]

#### Subcluster > State

Enables up to 3 subclusters.

A cluster is composed of 20 spatially separated subpaths with equal powers. The subpaths are occasionally split to subsets or subclusters (also known as mid-paths) having different resolvable delays. In the SCM model, one cluster can be split into 3 subclusters, where the subclusters consist of 10, 6 and 4 subpaths. Hence, the subcluster power is 10/20, 6/20 and 4/20 relative power to the total cluster power.

See also "[Subcluster > Relative Gain /dB](#)" on page 119.

Remote command:

[[:SOURce<hw> :FSIMulator:SCM:TAP<st>:SUBCluster<di>:STATE](#)  
on page 230]

**Subcluster > Relative Gain /dB**

Displays the resulting relative attenuation, applied on an enabled subcluster. The value is determined based on the select "Relative Gain" of the cluster and is calculated as follows:

$$\text{RelativeGain}_{\text{Sub-Cluster}} = \text{RelativeGain}_{\text{Cluster}} + \text{GainFactor}$$

The used gain factors are values in dB and are listed in "[Subcluster > Relative Gain /dB](#)" on page 119.

*Table 5-2: Overview: Gain factors and default relative gain values per subcluster*

Sub-Cluster number	Gain factor, W	Subpath number	Gain factor, dB
1	10/20	1, 2, 3, 4, 5, 6, 7, 8, 19, 20	-3.01
2	6/20	9, 10, 11, 12, 17, 18	-5.229
3	4/20	13, 14, 15, 16	-6.99

Remote command:

[\[:SOURce<hw>\]:FSIMulator:SCM:TAP<st>:SUBCluster<di>:GAIN](#)  
on page 230

**Angle of Departure (AoD)**

Sets the AoD (angle of departure) of the cluster.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:SCM:TAP<st>:DEParture:ANGLE](#) on page 229

**AoD Spread**

Sets the AoD (angle of departure) spread (AS) of the cluster.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:SCM:TAP<st>:DEParture:SPRead](#) on page 229

**Angle of Arrival (AoA)**

Sets the AoA (angle of arrival) of the cluster.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:SCM:TAP<st>:ARRival:ANGLE](#) on page 229

**AoA Spread**

Sets the AoA (angle of arrival) spread (AS) of the cluster.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:SCM:TAP<st>:ARRival:SPRead](#) on page 229

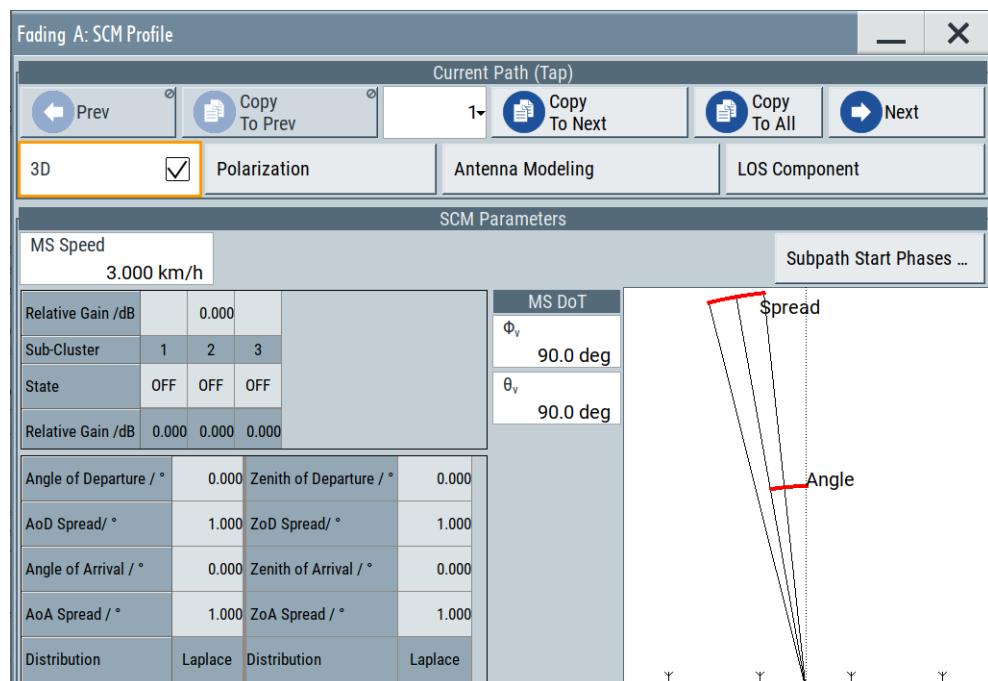

**Distribution**

Displays the distribution of the cluster.

### 5.3.7.2 3D channel model

Access:

1. Enable a MIMO configuration.  
See "[To enable a MIMO scenario](#)" on page 95.
2. Select "Fading > Path Table > Path# > Profile > SCM".
3. Select "SCM Profile > 3D > On".

Most of the settings are the same as for the 2D SCM model.

In the following, listed are only the dedicated 3D model setting: the zenith dimension and its parameters.

#### Settings

<a href="#">3D</a>	120
<a href="#">MS DoT &gt; <math>\phi_v/\Theta_v</math></a>	121
<a href="#">Zenith of Departure</a>	121
<a href="#">ZoD Spread</a>	121
<a href="#">Zenith of Arrival (ZoA)</a>	121
<a href="#">ZoA Spread</a>	121

#### 3D

Enables the 3D geometry-based channel model.

Remote command:

`[ :SOURce<hw> ] :FSIMulator:SCM:D3Mode:STATE` on page 227

**MS DoT >  $\phi_v/\Theta_v$** 

Sets the direction of travel of the mobile station as travel azimuth angle ( $\phi_v$ ) and elevation angle ( $\Theta_v$ ).

Remote command:

[ :SOURce<hw>] :FSIMulator:SCM:PHI on page 228

[ :SOURce<hw>] :FSIMulator:SCM:THETA on page 228

**Zenith of Departure**

Sets the zenith of departure (ZoD) of the cluster.

Remote command:

[ :SOURce<hw>] :FSIMulator:SCM:TAP<st>:DEParture:ZENith:ANGLE on page 229

**ZoD Spread**

Sets the ZoD (zenith of departure) spread of the cluster.

Remote command:

[ :SOURce<hw>] :FSIMulator:SCM:TAP<st>:DEParture:ZENith:SPRead on page 229

**Zenith of Arrival (ZoA)**

Sets the ZoA (zenith of arrival) of the cluster.

Remote command:

[ :SOURce<hw>] :FSIMulator:SCM:TAP<st>:ARRival:ZENith:ANGLE on page 229

**ZoA Spread**

Sets the ZoA (zenith of arrival) spread of the cluster.

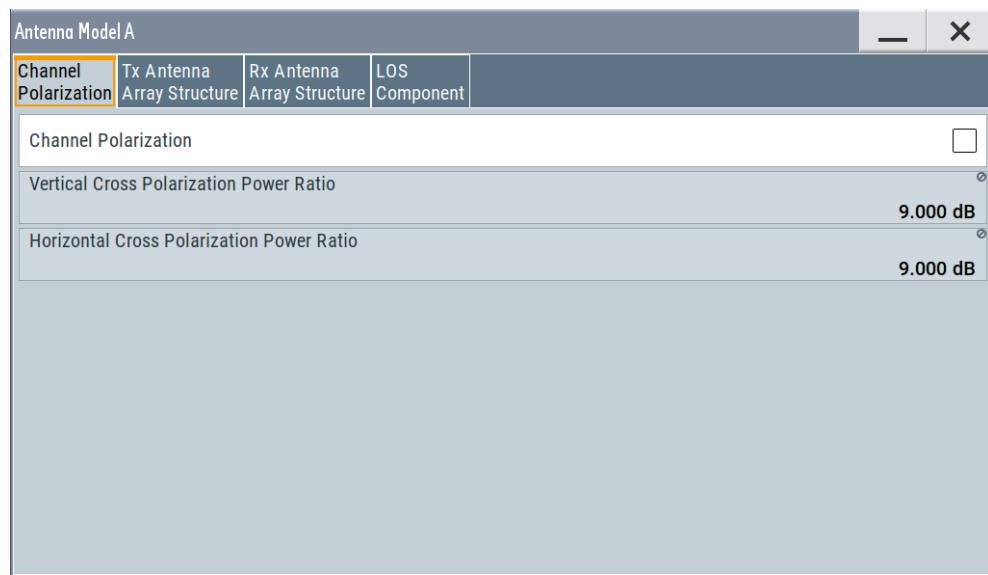

Remote command:

[ :SOURce<hw>] :FSIMulator:SCM:TAP<st>:ARRival:ZENith:SPRead on page 229

### 5.3.7.3 Channel polarization settings

Access:

1. Enable a MIMO configuration.  
See "[To enable a MIMO scenario](#)" on page 95.
2. Select "Fading > Path Table > Path# > Profile > SCM".
3. Select "SCM Profile > SCM Data"
4. Select "Polarization".
5. Select "Channel Polarization > On".
6. Set the XPR (cross polarization power ratios) values.

### Settings:

**Note:** In multi-entity configurations, like, for example, 2x4x4 or 4x2x2, the settings in the dialogs "Channel Polarization" and "Rx Antenna Array Structure" **apply to all entities**.

Channel Polarization State.....	122
Vertical/Horizontal Cross Polarization Power Ratio.....	122

#### Channel Polarization State

Enables/disables simulation of channel polarization.

Remote command:

`[ :SOURce<hw> ] :FSIMulator:SCM:POLarization:STATE` on page 231

#### Vertical/Horizontal Cross Polarization Power Ratio

Sets the cross polarization power ratio (XPR) in dB.

$XPR_v = P/P_{vhv}$  and  $XPR_h = P/P_{hhv}$ , where  $XPR_v = XPR_h = XPR$ .

Remote command:

`[ :SOURce<hw> ] :FSIMulator:SCM:POLarization:PRATio:HORIZONTAL`  
on page 231

`[ :SOURce<hw> ] :FSIMulator:SCM:POLarization:PRATio:VERTICAL`  
on page 231

### 5.3.7.4 Antenna modeling settings

Access:

1. Enable a MIMO configuration.  
See "[To enable a MIMO scenario](#)" on page 95.
2. Select "Fading > Path Table > Path# > Profile > SCM".

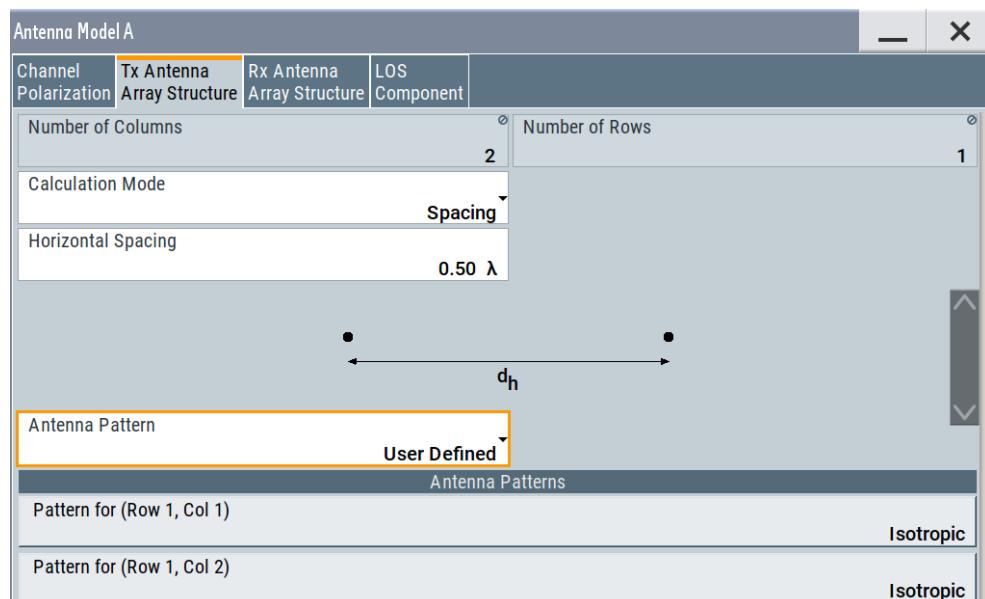

3. Select "SCM Profile > SCM Data"
4. Select "Antenna Modeling".
5. Configure the base station (BS) antenna settings, for example:
  - "Tx Antenn Array Structure > Calculation Mode > Spacing", if the spacing (i.e. the physical distance) between the antenna elements is a known value.
  - "Horizontal Spacing = 0.5\*λ"

For mobile devices, however, the measured characteristics are the antenna radiation pattern, gain and relative phase.

To use the relative phase instead of the antenna spacing, *provide the relative phase information in the antenna pattern file*. When this file is loaded, the relative phase information is extracted from it and used in the calculations.

See also [Figure 5-14](#).
- a) To load custom antenna pattern for the transmit or the receive antenna:
  - "Select Antenna Pattern > User Defined".
  - For each antenna element, navigate to the antenna pattern file and load it.

The selected 2D antenna pattern file describes the BS and MS antenna gains of each array element.

A figure displays the structure of the current antenna array. The number of columns and rows in the array are set automatically, depending on the selected MIMO configuration.

#### Settings:

<a href="#">Antenna Structure</a>	124
<a href="#">Number of Rows (M)/Columns (N)</a>	124
<a href="#">Calculation Mode</a>	124
<a href="#">Horizontal Spacing</a>	125
<a href="#">Vertical Spacing</a>	125

Antenna array.....	125
Antenna Pattern.....	125
User Defined Antenna Patterns per Row, Column.....	126

### **Antenna Structure**

If **3D** > "On", sets the antenna array structure.

See "[Antenna array](#)" on page 132.

Remote command:

[**:SOURce<hw>]:FSIMulator:SCM:ANTenna:TX:STRucture** on page 232 [**:SOURce]:FSIMulator:SCM:ANTenna:RX:STRucture** on page 232]

### **Number of Rows (M)/Columns (N)**

Sets the number of rows (M) and the number of columns (N) in the antenna array, see "[Antenna Modeling](#)" on page 132.

The number of Tx and Rx antennas is set automatically according to the selected LxMxN MIMO configuration ("System Configuration > LxMxN"). Supported are configurations with L = 1, 2 or 4 even number of Tx and Rx antennas.

See section "Signal Routing and System Configuration" in the R&S SMW user manual.

Remote command:

[**:SOURce]:FSIMulator:SCM:ANTenna:RX:COLumns[:SIZE]** on page 233  
**[:SOURce]:FSIMulator:SCM:ANTenna:RX:ROWS[:SIZE]?** on page 233  
**[:SOURce<hw>]:FSIMulator:SCM:ANTenna:TX:COLumns[:SIZE]** on page 233  
**[:SOURce<hw>]:FSIMulator:SCM:ANTenna:TX:ROWS[:SIZE]?** on page 233

### **Calculation Mode**

Selects how the phase information is calculated.

See [Figure 5-14](#).

"Spacing"      The phase information is calculated from the spacing between the antenna elements.  
 The spacing (i.e. the physical distance) between the antenna elements is set with the parameter [Horizontal Spacing](#).

"Relative Phase"

If the loaded antenna pattern file contains the required information, the relative phase is extracted from the antenna pattern file.

See:

- ["Antenna element spacing or relative phase"](#) on page 132
- [Chapter B, "Antenna pattern file format",](#) on page 348.

"Analog Beamforming"

In this mode, the composite antenna pattern of an antenna array comprising gain and phase can be used to simulate analog beamforming. The co-polarized antenna elements of the array are combined to a single RF port.

Remote command:

[**:SOURce]:FSIMulator:SCM:ANTenna:RX:CALC:MODE** on page 232  
**[:SOURce<hw>]:FSIMulator:SCM:ANTenna:TX:CALC:MODE** on page 232

### Horizontal Spacing

For "Calculation Mode > Spacing", sets the distance ( $d_h$ ) between the antennas in the antenna array normalized by the wavelength  $\lambda$ .

It is calculated as follows:

$$d_h = \text{"Horizontal Spacing"} * \lambda$$

Where:

- $\lambda$  is the wavelength calculated as  $\lambda = c/\text{"Frequency"}$
- $c$  is the speed of light
- "Frequency" is the center frequency.

See also "[Antenna element spacing or relative phase](#)" on page 132.

Remote command:

`[ :SOURce<hw> ] :FSIMulator:SCM:ANTenna:TX:ESPacing:Horizontal`  
on page 233

`[ :SOURce ] :FSIMulator:SCM:ANTenna:RX:ESPacing:Horizontal`  
on page 233

### Vertical Spacing

If **3D** > "On", "Calculation Mode > Spacing" and "Number of Rows  $\geq 2$ ", sets the distance ( $d_v$ ) between the antennas in the antenna array normalized by the wavelength  $\lambda$ .

It is calculated as follows:

$$d_v = \text{"Vertical Spacing"} * \lambda$$

Where:

- $\lambda$  is the wavelength calculated as  $\lambda = c/\text{"Frequency"}$
- $c$  is the speed of light
- "Frequency" is the center frequency.

See also "[Antenna element spacing or relative phase](#)" on page 132.

Remote command:

`[ :SOURce<hw> ] :FSIMulator:SCM:ANTenna:TX:ESPacing:VERTical`  
on page 233

`[ :SOURce ] :FSIMulator:SCM:ANTenna:RX:ESPacing:VERTical` on page 233

### Antenna array

Graphical representation of the current antenna array.

Each dot indicates a single antenna element.

The spacing between the antenna elements is indicated, if "Calculation Mode > Spacing" is used.

### Antenna Pattern

Antenna patterns are files that describe the 2D or 3D antenna radiation pattern.

The following predefined antenna patterns are available:

- "Isotropic"
- "Dipole"
- "3 Sectors" and "6 Sectors"

These two sector antenna patterns are required for the BS testing, as specified in the [TR 25.996](#).

- "Dual Polarization Isotropic"

You can also load custom antenna pattern, see "[User Defined Antenna Patterns per Row, Column](#)" on page 126.

Remote command:

[**:SOURce<hw>**] [**:FSIMulator:SCM:ANTenna:TX:PATTERn** on page 233]

[**:SOURce**] [**:FSIMulator:SCM:ANTenna:RX:PATTERn** on page 233]

#### User Defined Antenna Patterns per Row, Column

Indicates the custom antenna pattern file per antenna element.

To change the used file for an antenna element:

- Select a predefined or "User File"
- Navigate to the antenna pattern file and load it.

Antenna pattern files are XML files with file predefined file syntax and extension \*.ant\_pat.

They describe the antenna pattern as an array with typical resolutions of 1 degree to 5 degrees for the azimuth. These files contain the gain values for a given azimuth. For an isotropic antenna radiating energy equally in all directions, the array elements are all 0 dB.

Remote command:

[**:SOURce<hw>**] [**:FSIMulator:SCM:ANTenna:TX:ANTenna<di>:PFILE** on page 234]

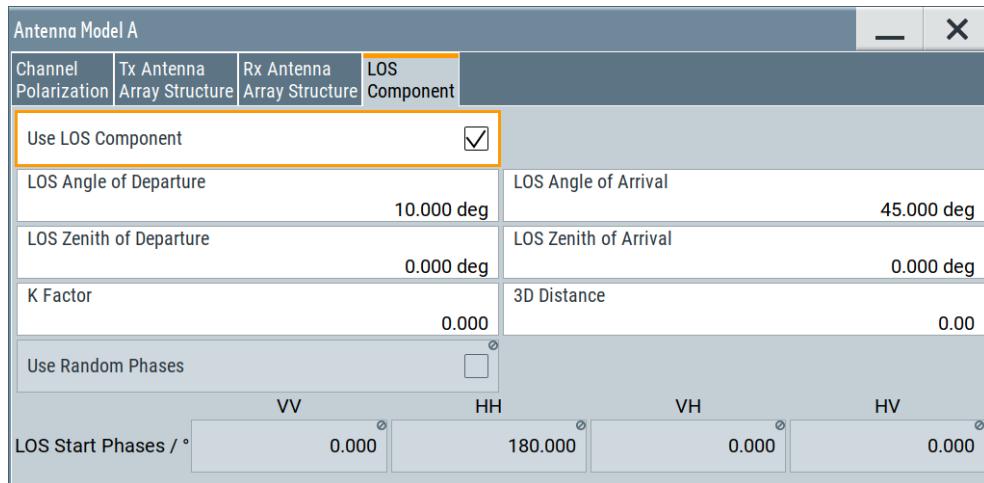

[**:SOURce**] [**:FSIMulator:SCM:ANTenna:RX:ANTenna<di>:PFILE** on page 234]

##### 5.3.7.5 LOS component settings

Access:

1. Enable a MIMO configuration.  
See "[To enable a MIMO scenario](#)" on page 95.
2. Select "Fading > Path Table > Path# > Profile > SCM".
3. Select "SCM Profile > SCM Data"

4. Select "LOS Component".

The LOS modeling is based on the ricean K factor. It is defined as the ratio of power in the LOS component to the total power in the diffused non line-of-sight (NLOS) component.

#### Settings:

<a href="#">Use LOS Component</a>	127
<a href="#">LOS Angle of Departure (AoD)</a>	127
<a href="#">LOS Angle of Arrival (AoA)</a>	127
<a href="#">LOS Zenith of Departure</a>	128
<a href="#">LOS Zenith of Arrival</a>	128
<a href="#">K Factor</a>	128
<a href="#">3D Distance</a>	128
<a href="#">Use Random Phases</a>	128
<a href="#">LOS Start Phases</a>	128

#### Use LOS Component

Adds a line-of-sight (LOS) component to the cluster.

The LOS component is supported only in the first fading path.

To activate the LOS component:

- Set "Path Table > Fading Path#1 > State > On" and set "Profile > SCM".
- Set "SCM Data > LOS Component Settings > Use LOS Component > On".

Remote command:

[\[:SOURce<hw>\]:FSIMulator:SCM:LOS:STATE](#) on page 234

#### LOS Angle of Departure (AoD)

Sets the AoD (angle of departure) of the LOS component.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:SCM:LOS:DEParture\[:ANGLE\]](#) on page 234

#### LOS Angle of Arrival (AoA)

Sets the AoA (angle of arrival) of the LOS component.

Remote command:

[**:SOURce<hw>]:FSIMulator:SCM:LOS:ARRival[:ANGLE]** on page 234

#### **LOS Zenith of Departure**

If **3D** > "On", sets the ZoD (zenith of departure) of the LOS component.

Remote command:

[**:SOURce<hw>]:FSIMulator:SCM:LOS:DEParture:ZENith:ANGLE**  
on page 234

#### **LOS Zenith of Arrival**

If **3D** > "On", sets the ZoA (zenith of arrival) of the LOS component.

Remote command:

[**:SOURce<hw>]:FSIMulator:SCM:LOS:ARRival:ZENith:ANGLE** on page 234

#### **K Factor**

Sets the ricean K factor.

The K factor is defined as the ratio of power in the LOS component to the total power in the diffused non line-of-sight (NLOS) component.

Remote command:

[**:SOURce<hw>]:FSIMulator:SCM:LOS:KFACTOR** on page 235

#### **3D Distance**

If **3D** > "On", sets the distance between the base station (BS) and the user terminal (UT).

The value is used to calculate the phase shift of the LOS component.

Remote command:

[**:SOURce<hw>]:FSIMulator:SCM:LOS:DISTANCE** on page 235

#### **Use Random Phases**

If enabled, random subpath start phases are selected.

Remote command:

[**:SOURce<hw>]:FSIMulator:SCM:LOS:RANDOM:PHASE:STATE** on page 235

#### **LOS Start Phases**

Sets the start phase in degree of the LOS signal per MIMO channel.

Remote command:

[**:SOURce<hw>]:FSIMulator:SCM:LOS:RANDOM:PHASE:VV** on page 236

[**:SOURce<hw>]:FSIMulator:SCM:LOS:RANDOM:PHASE:HH** on page 236

[**:SOURce<hw>]:FSIMulator:SCM:LOS:RANDOM:PHASE:VH** on page 236

[**:SOURce<hw>]:FSIMulator:SCM:LOS:RANDOM:PHASE:HV** on page 236

### **5.3.7.6 Subpath start phases**

Access:

1. Enable a MIMO configuration.

See "[To enable a MIMO scenario](#)" on page 95.

2. Select "Fading > Path Table > Path# > Profile > SCM".
3. Select "SCM Profile > SCM Data"
4. Select "Subpath Start Phases".

The dialog box title is "Fading A: Subpath Start Phases Tap1". The table has a header row with columns: VV / °, HH / °, VH / °, HV / °. Below the header are 9 rows, each representing a subpath from 1 to 9. Each row contains four numerical values (0.000) under the respective headers. An orange border highlights the first row. A checked checkbox labeled "Use Random Start Phases" is located at the top right of the table area.

	VV / °	HH / °	VH / °	HV / °
Subpath 1	0.000	0.000	0.000	0.000
Subpath 2	0.000	0.000	0.000	0.000
Subpath 3	0.000	0.000	0.000	0.000
Subpath 4	0.000	0.000	0.000	0.000
Subpath 5	0.000	0.000	0.000	0.000
Subpath 6	0.000	0.000	0.000	0.000
Subpath 7	0.000	0.000	0.000	0.000
Subpath 8	0.000	0.000	0.000	0.000
Subpath 9	0.000	0.000	0.000	0.000

#### Settings:

Use Random Phases.....	129
Subpath # > VV/HH/VH/HV Phase.....	129

#### Use Random Phases

If enabled, random start phases are selected.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:SCM:TAP<st>:SUBPath:STATE](#) on page 231

#### Subpath # > VV/HH/VH/HV Phase

Sets the phase per subpath.

A total number of 20 subpaths are supported.

Remote command:

[\[:SOURce<hw>\]:FSIMulator:SCM:TAP<st>:SUBPath<di>:PHASE:HH](#)  
on page 236

[\[:SOURce<hw>\]:FSIMulator:SCM:TAP<st>:SUBPath<di>:PHASE:HV](#)  
on page 236

[\[:SOURce<hw>\]:FSIMulator:SCM:TAP<st>:SUBPath<di>:PHASE:VH](#)  
on page 236

[\[:SOURce<hw>\]:FSIMulator:SCM:TAP<st>:SUBPath<di>:PHASE:VV](#)  
on page 236

### 5.3.8 MIMO OTA testing related settings

The MIMO OTA testing is a term describing radiated testing of mobile devices. The signal is transmitted over-the-air (OTA) to a mobile device placed in an anechoic chamber. The mobile devices are tested in a real-word like conditions.

This section introduces the main concept of the two-stage method. You find the complete description of this method in the [TR 37.977](#) specification.

#### About the MIMO OTA two stage method

According to [TR 37.977](#), the method consists of two stages:

- **Acquiring the complex antenna radiation pattern of the DUT**

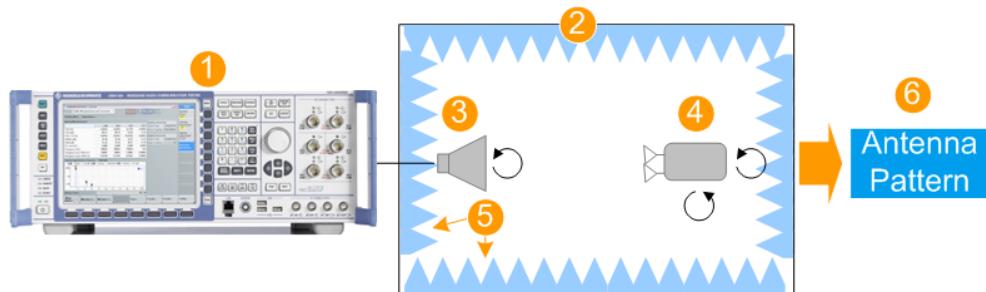

Figure 5-10: MIMO OTA testing: stage 1 [TR 37.977]

- 1 = Base station (BS) emulator
- 2 = Test chamber
- 3 = Reference antenna
- 4 = MIMO DUT (mobile device)
- 5 = Anechoic material
- 6 = Measurement result: antenna radiation pattern

The measurement is performed in an over-the-air (OTA) test setup. The DUT is placed in an anechoic chamber.

The antenna radiation pattern is measured of each antenna element.

- **Convolving the antenna pattern with the channel model**

The measured antenna pattern is loaded into the MIMO channel emulator. The DUT performance is measured with throughput tests.

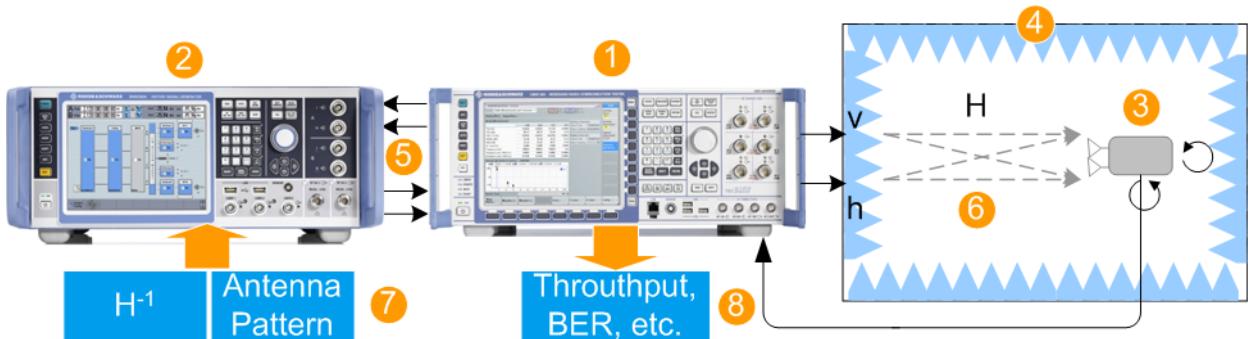

**Figure 5-11: MIMO OTA testing: stage 2 (conducted setup)**

- 1 = BS emulator
- 2 = Channel emulator
- 3 = DUT with standard antenna ports (as for conducted conformance tests)
- 4 = Connection between the BS and the channel emulator ([DIG I/Q] interface)
- 5 = Cable connection between the BS emulator and the DUT
- 6 = Antenna radiation pattern, as measured in stage 1
- 7 = Measurement result

The measurements in this second stage can be performed in a conducted or in a radiated (OTA) setup.

The radiated tests assure that the self-interference effects between the antenna elements of the DUT are also considered.

**Figure 5-12: MIMO OTA testing: stage 2 (radiated setup)**

- 1 = BS emulator
- 2 = Channel emulator
- 3 = MIMO DUT
- 4 = Anechoic chamber
- 5 = Connection between the BS and the channel emulator ([DIG I/Q] interface)
- v, h = Probe antennas with vertical (v) and horizontal (h) polarization, co-located in the anechoic chamber
- H = Radiated channel matrix of the chamber
- 6 = Radiated connection to the DUT
- 7 = Antenna radiation pattern (as measured in stage 1) and the inverted channel matrix  $H^{-1}$  of the chamber
- 8 = Measurement result

The test setup consists of a BS emulator, a channel emulator, a DUT placed in an anechoic or a reverberation chamber and a reference antenna. In the examples on [Figure 5-10](#), [Figure 5-11](#) and [Figure 5-12](#), the R&S®CMW acts as BS emulator and the R&S SMW as a channel simulator. Approved RF cables are used for all connections.

In the two-stage method, the R&S SMW takes over the convolving of the antenna pattern with standard compliant channel model (SCME UMi and UMa). If the channel matrix  $H$  of the chamber is known, the R&S SMW can apply the inverse channel matrix  $H^{-1}$ . The signal received at the DUT antennas is thus the same as in the cable-conducted method.

### Antenna Modeling

The antenna modeling includes the definition of the:

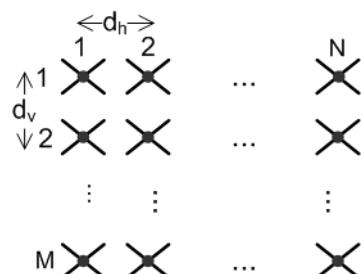

- Antenna array structure  
(see "[Antenna array](#)" on page 132)
- Antenna polarization  
(see "[Antenna polarization](#)" on page 133)
- Antenna radiation pattern  
(see [Chapter B, "Antenna pattern file format"](#), on page 348)

### Antenna array

The antenna model is based on a **2D planar antenna array** structure. The antenna elements are placed in the vertical and horizontal direction in an array composed of  $N$  columns and  $M$  rows (see [Figure 5-13](#)). The antenna elements are uniformly spaced.

The horizontal and vertical spacings between the antenna columns are  $d_h * \lambda$  and  $d_v * \lambda$ . The spacing between the antenna pairs of cross-polarized antennas is denoted as cross polarized antenna spacing  $d_{xp} * \lambda$ .

In the current firmware version, the antenna elements are placed on a single row and vertical spacing is not supported.

*Figure 5-13: 2D planar antenna array structure where each column is a cross-polarized 45° antenna with  $d_{xp} = 0 * \lambda$*

The user interface illustrates the selected antenna array similarly.

### Antenna element spacing or relative phase

If the **spacing between** the antenna elements is unknown, the antenna **relative phase** can be used instead (see [Figure 5-14](#)). Which information is used is defined with the parameter [Calculation Mode](#).

If [Calculation Mode > "Relative Phase"](#), the following applies:

- If all selected antenna pattern files contain the relative phase information, it is extracted from there.

(see [Chapter B, "Antenna pattern file format", on page 348](#))

- If *one* of the selected antenna pattern files contain relative phase information, this information is used. The relative phase values in all other selected antenna pattern files are assumed to be zero.
- If *none* of the selected antenna pattern files contain relative phase information, the following settings apply: "Spacing = 0.5\* $\lambda$ ".

### Antenna polarization

The polarization of an antenna describes the orientation of the electric wave radiated by the antenna.

According to [TR 25.996](#), using antenna polarization requires that the antenna complex response for both vertical and horizontal components is known.

Provide the antenna polarization information in one of the following ways:

- Described in the **antenna pattern file** and extracted from there

To use this way:

- Create and load an antenna pattern file containing **both** the horizontal and vertical polarization antenna radiation patterns  
(see [Chapter B, "Antenna pattern file format", on page 348](#))
- Activate channel polarization [Channel Polarization State](#) > "On"
- Select [Antenna Polarization Mode](#) > "Separate AP".

- Selected with the parameter "**Antenna Polarization Slant Angle**"

To use this way:

- Load an antenna pattern file containing **only one** antenna pattern.
- Activate channel polarization [Channel Polarization State](#) > "On"
- Select [Antenna Polarization Mode](#) > "Single AP with Slant Angle".
- Set the parameter "Antenna Polarization Slant Angle".

Available polarization angles are:

- Horizontal polarization
- Vertical polarization
- Cross-polarization 90°
- Cross-polarization 45°

### Channel polarization

The channel correlation polarization matrix is computed from the antenna element polarization angles and the XPR (cross polarization power ratio of a propagation channel) values.

See:

- "[Antenna polarization](#)" on page 133
- "[Vertical/Horizontal Cross Polarization Power Ratio](#)" on page 137.

### Channel correlation matrix

The total **channel correlation matrix  $\mathbf{R}$**  is the result of the element-wise product of the polarization correlation matrix  $\mathbf{R}_P$  and the spatial correlation matrix  $\mathbf{R}_S$ :

$$\mathbf{R} = \mathbf{R}_P * \mathbf{R}_S.$$

In the following, we assume that:

- The elements of the channel polarization matrix are uncorrelated
- The transmitter and the receiver ends are uncorrelated

The polarization and spatial correlation matrices,  $\mathbf{R}_P$  and  $\mathbf{R}_S$  are calculated as follows:

- **Spatial correlation matrix  $\mathbf{R}_S$**

The spatial correlation matrix depends on the spatial characteristics of the channel:

- Antenna radiation patterns at the transmitter and the receiver ends
- Antenna spacing
- Power azimuth spectrum PAS of the clusters

The correlation between antenna array elements  $n$  and  $m$  is calculated according to the Schumacher model [2].

$$\rho_{n,m} = \frac{\int_{-\pi}^{\pi} e^{-j2\pi\frac{d}{\lambda}\sin\phi} PAS(\phi) \sqrt{G_n(\phi)G_m(\phi)} d\phi}{\sqrt{\int_{-\pi}^{\pi} PAS(\phi)G_n(\phi)d\phi} \sqrt{\int_{-\pi}^{\pi} PAS(\phi)G_m(\phi)d\phi}}$$

*Figure 5-14: Schumacher model for calculation the correlation between antenna array elements [2]*

$\rho_{n,m}$	= Correlation between antenna array elements
$m, n$	= Antenna array elements
$d$	= Antenna spacing between the two antenna elements
$\lambda$	= Wavelength of the signal
$PAS(\phi)$	= Power azimuth spectrum of the impinging signal
$G_n(\phi), G_m(\phi)$	= Antenna radiation patterns, characterized by a power gain, for antenna elements $n$ and $m$

**Note:** The magnitude  $e^{-j2\pi d/\lambda(\sin\phi)}$  is also the relative phase resulting from the spacing  $d$  and the angle  $\phi$ . For a known relative phase  $\varphi$ , the magnitude is calculated as  $e^{j\varphi}$ .

If the transmitter and the receiver ends are uncorrelated, then the total spatial channel correlation matrix is the Kronecker product of the two correlation matrices.

$$\mathbf{R}_S = \mathbf{R}_{Rx} \otimes \mathbf{R}_{Tx}$$

- **Polarization correlation matrix  $\mathbf{R}_P$**

Three matrices describe the polarization of the system: channel polarization  $S$ , the transmitter and the receiver antenna array polarizations  $P_{Tx}$  and  $P_{Rx}$ .

### Related settings

See:

- [Chapter 5.3.8.2, "Antenna model settings", on page 138](#)

- [Chapter 5.3.8.1, "Channel polarization settings", on page 135](#)
- [Chapter 5.3.9, "Inverse channel matrix", on page 144](#)

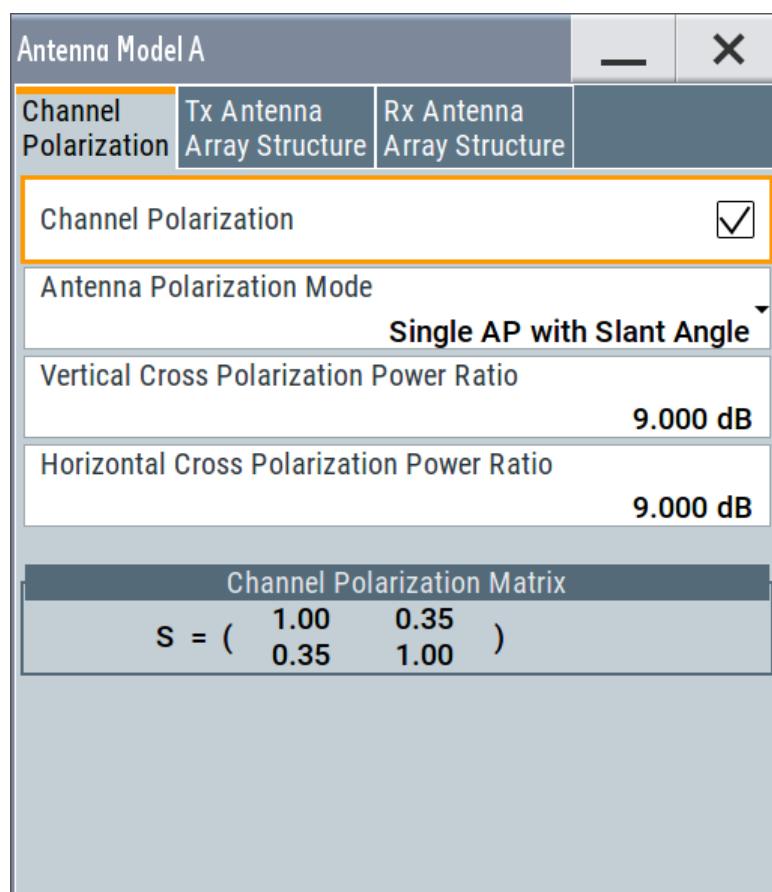

See also:

- [Chapter B, "Antenna pattern file format", on page 348](#)
- [Chapter 5.3.6, "SCME/WINNER model settings", on page 112](#)
- [Chapter A.16, "SCM and SCME channel models for MIMO OTA", on page 308](#)

### 5.3.8.1 Channel polarization settings

Access:

1. Enable a MIMO configuration, e.g. a 2x2 MIMO scenario.  
See "[To enable a MIMO scenario](#)" on page 95.
2. Select "Fading > Path Table > Matrix"
3. In the required "Tap", select "Fading: Correlation Matrix > Matrix Mode > SCME / WINNER"
4. Select "Fading: Correlation Matrix > Polarization".

5. Select "Channel Polarization > On".

6. Set the XPR (cross polarization power ratios) values.

**Note:** In multi-entity configurations, like, for example, 2x4x4 or 4x2x2, the settings in the dialogs "Channel Polarization" and "Rx Antenna Array Structure" **apply to all entities**.

7. Set the parameter "Antenna Polarization Mode", depending on the information in the used antenna pattern files.

For example, if your files contain both vertical and horizontal gain information, select "Antenna Polarization Mode > Separate AP".

8. Load the antenna pattern files.

See "[User Defined Antenna Patterns per Row, Column](#)" on page 143.

The calculated channel polarization matrix is displayed.

See also:

- [Chapter B, "Antenna pattern file format"](#), on page 348
- ["Channel correlation matrix"](#) on page 134

#### Settings:

<a href="#">Channel Polarization State</a> .....	136
<a href="#">Antenna Polarization Mode</a> .....	136
<a href="#">Vertical/Horizontal Cross Polarization Power Ratio</a> .....	137
<a href="#">S</a> .....	137

#### Channel Polarization State

Enables/disables simulation of channel polarization.

Remote command:

`[ :SOURce<hw> ] :FSIMulator:MIMO:ANTenna:MODEling [:STATE]` on page 213

#### Antenna Polarization Mode

Sets way the software extracts or calculates the antenna polarization patterns.

"Single AP with Slant Angle"

The antenna pattern file contains one antenna radiation pattern.

The antenna polarization is calculated from the provided antenna pattern and the polarization angle, as selected with the parameter [Antenna Polarization Slant Angle](#).

See also "[Antenna polarization](#)" on page 133.

- "Separate AP"    Option: R&S SMW-K73  
 The antenna pattern file has to describe two antenna radiation patterns, one for each polarization (see [Chapter B, "Antenna pattern file format"](#), on page 348).  
 The correlation between any two channels for the same path is calculated as follows [3]:

$$E\{h_{pn}(t)h_{qn}^*(t)\} = \sqrt{P_{pn}P_{qn}} \left( \gamma_{mn}^{Tx(v)} \gamma_{pq}^{Rx(v)} + \frac{1}{XPD} \gamma_{mn}^{Tx(h)} \gamma_{pq}^{Rx(v)} + \frac{1}{XPD} \gamma_{mn}^{Tx(v)} \gamma_{pq}^{Rx(h)} + \gamma_{mn}^{Tx(h)} \gamma_{pq}^{Rx(h)} \right)$$

**Figure 5-15: Calculation of the correlation between channels [3]**

$P_{pm}, P_{qn}$  = Powers transferred through the subchannels ( $Tx_p - Rx_m$ ) and ( $Tx_q - Rx_n$ );  
 in this implementation,  $P_{pm} = P_{qn} = 1$   
 $\gamma_{mn}^{Tx}, \gamma_{pq}^{Rx}$  = Correlation coefficient between antenna elements in the transmitter and receiver array; values per polarization  
 $Tx, Rx$  = Transmitter and receiver array  
 $v, h$  = Vertical and horizontal polarization  
 $n, m / p, q$  = Antenna elements in the transmitter/receiver array

Remote command:

[**:SOURce<hw> :FSIMulator:MIMO:ANTenna:PATTERn:MODE** on page 214

### Vertical/Horizontal Cross Polarization Power Ratio

Sets the cross polarization power ratio (XPR) in dB.

$XPR_v = P/P_{vhv}$  and  $XPR_h = P/P_{hhv}$ , where  $XPR_v = XPR_h = XPR$ .

The resulting channel polarization matrix **S** is displayed.

Remote command:

[**:SOURce] :FSIMulator:MIMO:ANTenna:POLarization:PRATio:HORIZONTAL** on page 214

[**:SOURce] :FSIMulator:MIMO:ANTenna:POLarization:PRATio:VERTICAL** on page 214

### S

Displays the resulting *channel polarization* matrix S calculated as:

$$S = \begin{bmatrix} S_{vv} & S_{vh} \\ S_{hv} & S_{hh} \end{bmatrix}$$

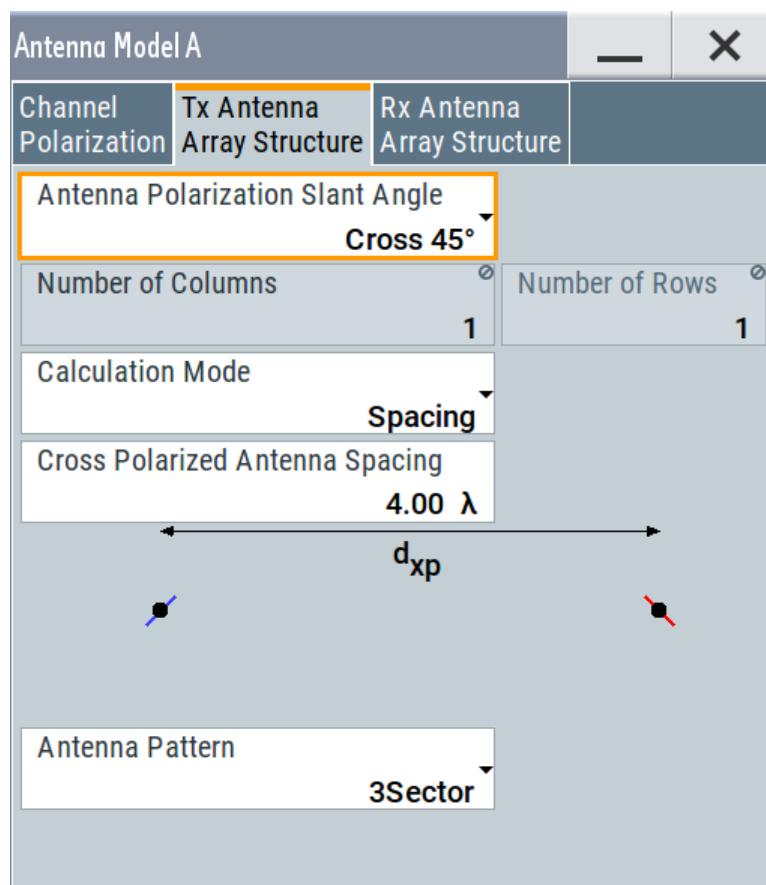

Where:

- $S_{vv} = S_{hh} = 1$
- $S_{vh}$  and  $S_{hv}$  are commonly designated as  $S_{xy}$  and are calculated from the equation **E{Sxy<sup>2</sup>} = Pxy**  
 where:
  - E is the expectation, i.e. the mean power per polarization component
  - $P_{xy}$  values are derived from the selected [Vertical/Horizontal Cross Polarization Power Ratio XPR](#).
- It is assumed that the elements of the channel polarization matrix are uncorrelated, i.e.:
 
$$E\{S_{ij}S_{lk}^*\} = 0 \text{ for } i \neq j, k \neq l$$

### 5.3.8.2 Antenna model settings

Access:

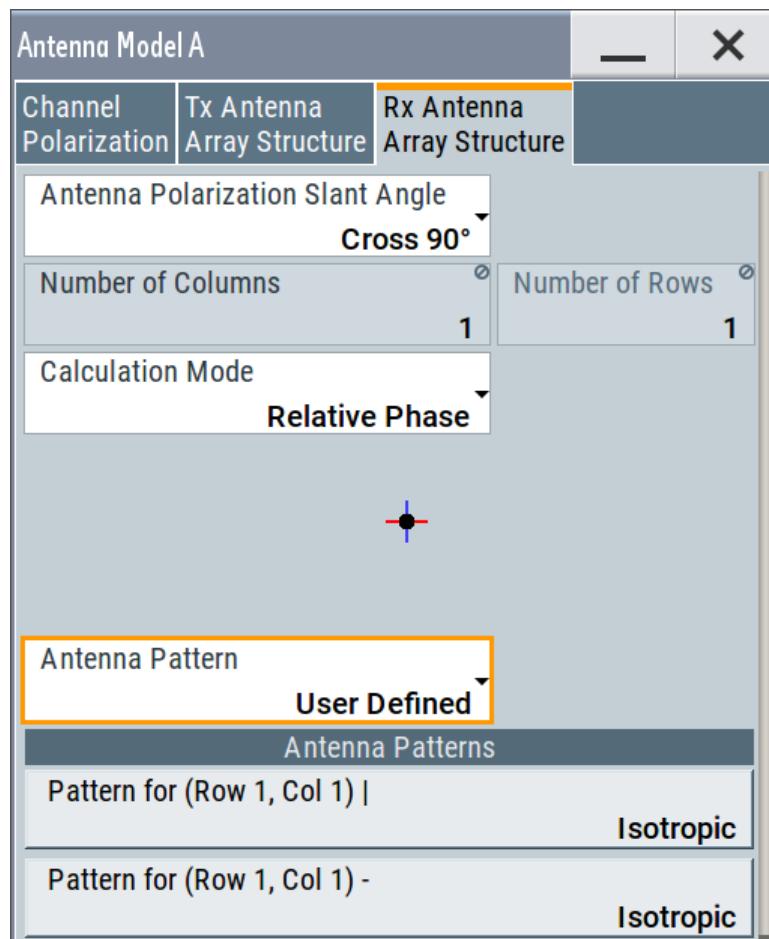

1. Enable a MIMO configuration, e.g. a 2x2 MIMO scenario.  
See "[To enable a MIMO scenario](#)" on page 95.
2. Select "Fading > Path Table > Matrix"
3. In the required "Tap", select "Fading: Correlation Matrix > Matrix Mode > SCME / WINNER"
4. Select "Fading: Correlation Matrix > Antenna Modeling".
5. Configure the base station (BS) antenna settings, for example:
  - "Antenna Polarization Slant Angle > Cross 45°"
  - "Calculation Mode > Spacing", if the spacing (i.e. the physical distance) between the antenna elements is a known value.
  - "Horizontal Spacing = 4\*λ"
  - "Antenna Pattern > 3Sector"

A figure displays the structure of the current antenna array. The number of columns and rows in the array are set automatically, depending on the selected MIMO configuration.

- To configure the mobile station (MS) antenna settings, select "Rx Antenna Array Structure".

**Note:** In multi-entity configurations, like, for example, 2x4x4 or 4x2x2, the settings in the dialogs "Channel Polarization" and "Rx Antenna Array Structure" **apply to all entities**.

Sometimes, it is difficult to determine the antenna spacing of the mobile device; instead the relative phase is measured.

To use the relative phase instead of the antenna spacing, provide the relative phase information in the antenna pattern file. When this file is loaded, the relative phase information is extracted from it and used in the calculations.

See also [Figure 5-14](#).

- To load custom antenna pattern for the transmit or the receive antenna:

- "Select Antenna Pattern > User File".
- For each antenna element, navigate to the antenna pattern file and load it.

The selected 2D antenna pattern file describes the BS and MS antenna gains of each array element.

Depending on its format, the antenna pattern file contains the following information:

- Antenna gain information only

- Antenna gain and phase information
- Horizontal and vertical gain information
- Horizontal and vertical gain and phase information.

See also:

- [Chapter B, "Antenna pattern file format", on page 348](#)
- ["Antenna Modeling" on page 132.](#)
- ["Channel correlation matrix" on page 134](#)

#### Settings:

<a href="#">Antenna Polarization Slant Angle</a> .....	140
<a href="#">Number of Rows (M)/Columns (N)</a> .....	141
<a href="#">Calculation Mode</a> .....	141
<a href="#">Horizontal Spacing</a> .....	142
<a href="#">Cross-Polarized Antenna Spacing</a> .....	142
<a href="#">Antenna Array</a> .....	142
<a href="#">Antenna Pattern</a> .....	143
<a href="#">User Defined Antenna Patterns per Row, Column</a> .....	143

#### Antenna Polarization Slant Angle

The information on the antenna polarization at the Tx and Rx ends is required to calculate the channel polarization.

**Note:** In multi-entity configurations, like, for example, 2x4x4 or 4x2x2, the settings in the dialogs "Channel Polarization" and "Rx Antenna Array Structure" **apply to all entities**.

If channel polarization is activated ([Channel Polarization State > "On"](#)), specify the antenna polarization in one of the following ways:

- Described in the **antenna pattern file** and extracted from there.  
One antenna radiation pattern for each polarization if necessary.  
(The parameter "Antenna Polarization Slant Angle" is not necessary and not available.)
- Selected with the parameter **"Antenna Polarization Slant Angle"**

For information on the prerequisites and how to use these two ways, see ["Antenna polarization" on page 133](#).

The following polarizations are available:

- Horizontal polarization
- Vertical polarization
- Cross-polarization 90°
- Cross-polarization 45°

A graph displays the structure of the current antenna array.

See also:

- [Chapter B, "Antenna pattern file format", on page 348.](#)
- [Chapter A.16, "SCM and SCME channel models for MIMO OTA", on page 308](#)

Remote command:

`[ :SOURce] :FSIMulator:MIMO:ANTenna:RX:POLarization:ANGLE`

on page 214

`[ :SOURce<hw>] :FSIMulator:MIMO:ANTenna:TX:POLarization:ANGLE`

on page 214

**Number of Rows (M)/Columns (N)**

Sets the number of rows (M) and the number of columns (N) in the antenna array, see "[Antenna Modeling](#)" on page 132.

**Note:** In this firmware version, only one-dimensional arrays are supported.  
The antenna elements are placed in one row and only the horizontal spacing is considered.

The number of Tx and Rx antennas is set automatically according to the selected MxN MIMO configuration ("System Configuration > LxMxN").

See section "Signal Routing and System Configuration" in the R&S SMW user manual.

**Note:** In multi-entity configurations, like, for example, 2x4x4 or 4x2x2, the settings in the dialogs "Channel Polarization" and "Rx Antenna Array Structure" **apply to all entities**.

**Example:**

In an 1x4x2 MIMO configuration, there are 4 Tx and 2 Rx antennas.

The "Tx Antenna Array" consists of 4 antennas:

- if "Antenna Polarization Slant Angle > Horizontal/Vertical", these 4 antennas are placed in a row (4x1 array)
- if "Antenna Polarization Slant Angle > Cross-Polarization 45°/90°", there are exactly 2 columns and 1 row.

The "Rx Antenna Array" contains exactly 2 antennas, that can be distributed in one of the following ways:

- if "Antenna Polarization Slant Angle > Horizontal/Vertical", in 2 columns and 1 row (2x1 array)
- if "Antenna Polarization Slant Angle > Cross-Polarization 45°/90°", there is exactly 1 column and 1 row

In both arrays, a spacing  $d_{xp}$  can also exist between the cross polarized antenna elements.

**Remote command:**

[**:SOURce**] [**:FSIMulator:MIMO:ANTenna:RX:COLumn:SIZE** on page 214]

[**:SOURce<hw>**] [**:FSIMulator:MIMO:ANTenna:TX:ROWS:SIZE** on page 215]

**Calculation Mode**

Selects how the correlation between the antenna elements is calculated: based on the spacing between the antenna elements or on the relative phase.

See [Figure 5-14](#).

**Note:** In multi-entity configurations, like, for example, 2x4x4 or 4x2x2, the settings in the dialogs "Channel Polarization" and "Rx Antenna Array Structure" **apply to all entities**.

"Spacing"      The spacing (i.e. the physical distance) between the antenna elements is set with the parameter [Horizontal Spacing](#) or [Cross-Polarized Antenna Spacing](#).

### "Relative Phase"

Option: R&S SMW-K73

If the loaded antenna pattern file contains the required information, the relative phase is extracted from the antenna pattern file.

See:

- ["Antenna element spacing or relative phase" on page 132](#)
- [Chapter B, "Antenna pattern file format", on page 348.](#)

Remote command:

[\[:SOURce\] :FSIMulator:MIMO:ANTenna:RX:CALC:MODE on page 215](#)

[\[:SOURce<hw>\] :FSIMulator:MIMO:ANTenna:TX:CALC:MODE on page 215](#)

### Horizontal Spacing

For "Calculation Mode > Spacing", sets the distance ( $d_h$ ) between the antennas in the antenna array normalized by the wavelength  $\lambda$ .

It is calculated as follows:

$$d_h = \text{"Horizontal Spacing"} * \lambda$$

Where the wavelength is  $\lambda = c/\text{Frequency}$  and  $c$  is the speed of light.

See also ["Antenna element spacing or relative phase" on page 132.](#)

**Note:** In multi-entity configurations, like, for example, 2x4x4 or 4x2x2, the settings in the dialogs "Channel Polarization" and "Rx Antenna Array Structure" **apply to all entities**.

Remote command:

[\[:SOURce<hw>\] :FSIMulator:MIMO:ANTenna:TX:ESPacing:HORizontal on page 215](#)

[\[:SOURce\] :FSIMulator:MIMO:ANTenna:RX:ESPacing:HORizontal on page 215](#)

### Cross-Polarized Antenna Spacing

For "Calculation Mode > Spacing", set the distance ( $d_{xp}$ ) between the two antenna elements of a cross-polarized antenna pair normalized by the wavelength  $\lambda$ .

It is calculated as follows:

$$d_{xp} = \text{"Cross Polarized Antenna Spacing"} * \lambda$$

Where the wavelength is  $\lambda = c/\text{Frequency}$  and  $c$  is the speed of light.

**Note:** In multi-entity configurations, like, for example, 2x4x4 or 4x2x2, the settings in the dialogs "Channel Polarization" and "Rx Antenna Array Structure" **apply to all entities**.

Remote command:

[\[:SOURce<hw>\] :FSIMulator:MIMO:ANTenna:TX:ESPacing:CROSS on page 215](#)

[\[:SOURce\] :FSIMulator:MIMO:ANTenna:RX:ESPacing:CROSS on page 215](#)

### Antenna Array

Graphical representation of the current antenna array.

Each dot indicates a single antenna element. Small lines indicate the used polarization, if "Antenna Polarization Mode > Single AP with Slant Angle" is used.

The spacing between the antenna elements is indicated, if "Calculation Mode > Spacing" is used.

### Antenna Pattern

Antenna patterns are files that describe the 2D antenna radiation pattern.

**Note:** In multi-entity configurations, like, for example, 2x4x4 or 4x2x2, the settings in the dialogs "Channel Polarization" and "Rx Antenna Array Structure" **apply to all entities**.

The following predefined antenna patterns are available:

- "Isotropic"
- "Dipole"
- "3 Sectors" and "6 Sectors"  
These two sector antenna patterns are required for the BS testing, as specified in the [TR 25.996](#).
- "Dipole +45°/-45°"

The predefined files do not contain polarization and relative phase information. They are suitable, in the following cases:

- [Calculation Mode](#) > "Spacing" or "Relative Phase"  
(See "[Antenna element spacing or relative phase](#)" on page 132 for information on file handling in the second case.)
- [Antenna Polarization Mode](#) > "Single AP with Slant Angle"
- [Standard / Test Case](#) > "3GPP/LTE MIMO" > "SCME UMa/Umi"

You can also load custom antenna pattern, see "[User Defined Antenna Patterns per Row, Column](#)" on page 143.

Remote command:

`[ :SOURce<hw> ] :FSIMulator:MIMO:ANTenna:TX:PATtern` on page 216  
`[ :SOURce ] :FSIMulator:MIMO:ANTenna:RX:PATtern` on page 216

### User Defined Antenna Patterns per Row, Column

Indicates the custom antenna pattern file per antenna element.

**Note:** In multi-entity configurations, like, for example, 2x4x4 or 4x2x2, the settings in the dialogs "Channel Polarization" and "Rx Antenna Array Structure" **apply to all entities**.

To change the used file for an antenna element:

- Select a predefined or "User File"
- Navigate to the antenna pattern file and load it.

Antenna pattern files are XML files with file predefined file syntax and extension \*.ant\_pat.

They describe the antenna pattern as an array with typical resolutions of 1 degree to 5 degrees for the azimuth. These files contain the gain values for a given azimuth. For an isotropic antenna radiating energy equally in all directions, the array elements are all 0 dB.

Antenna pattern files can also contain the following information:

- Separate antenna patterns per antenna polarization
- Relative phase description, also per antenna polarization.

**Note:** Always use antenna pattern files that are suitable for the current setting.

The following features require a fully described antenna pattern file

- [Calculation Mode](#) > "Relative Phase"
- [Antenna Polarization Mode](#) > "Separate AP"
- [Use Inverse Channel Matrix](#) > "On".

For description of the file format, see [Chapter B, "Antenna pattern file format", on page 348](#).

Remote command:

```
[ :SOURce] :FSIMulator:MIMO:ANTenna:PATTERn:CATalog? on page 216  
[ :SOURce] :FSIMulator:MIMO:ANTenna:PATTERn:CATalog:USER?  
on page 216  
[ :SOURce<hw>] :FSIMulator:MIMO:ANTenna:TX:ANTenna<di>:PFILE  
on page 217  
[ :SOURce] :FSIMulator:MIMO:ANTenna:RX:ANTenna<di>:PFILE on page 217
```

### 5.3.9 Inverse channel matrix

Option: R&S SMW-B14 and R&S SMW-K73

Some test cases, like for example the MIMO OTA tests, specify actions to be taken to counteract the channel response of the channel between the test equipment and the DUT.

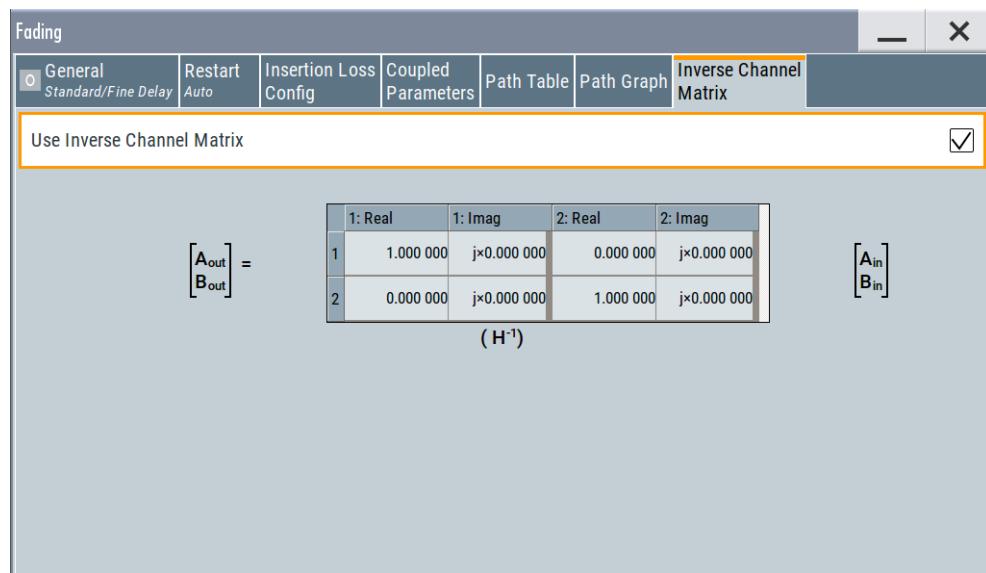

The process includes measuring the channel response matrix and applying the inverted version of this channel matrix to the generated signal. In the MIMO OTA tests using radiated tests for instance, signal generated in this way is received by the DUT as if a conducted test is used.

The inverse channel matrix is specified for the following test situations but can apply inverse channel matrix in any 2x2 MIMO scenario:

- MIMO OTA radiated testing  
See
- Applying SCM fading porfiles  
See [Chapter 5.3.7, "SCM fading profile", on page 116](#).

Access:

1. Enable a **2x2 MIMO** configuration.
2. Select "Fading > Inverse Channel Matrix"

### How to counteract the channel matrix of an anechoic chamber

To counteract the anechoic chamber channel matrix of the setup on [Figure 5-12](#) for example, apply the inverse channel matrix of the radiated channel. The radiated channel is the channel between the antenna probes and the DUT antennas inside the chamber.

Perform the following general steps:

1. Establish a radiated (over-the-air) MIMO connection to the DUT.
2. Measure the transmission matrix in the anechoic chamber.
3. Calculate the inverse matrix ( $H^{-1}$ ). Enter the inverse matrix values.
4. In the R&S SMW, enable a **2x2 MIMO** configuration.
5. Select "Fading > Inverse Channel Matrix"
6. Select "Use Inverse Channel Matrix > On".
7. Enter the calculated inverse matrix values.

The complex elements of the inverse channel matrix are applied on the transmitted signal to compensate for chamber effects.

### Settings

<a href="#">Use Inverse Channel Matrix</a> .....	145
<a href="#">Complex Matrix Elements (Real/Imag)</a> .....	146

#### Use Inverse Channel Matrix

Applies a 2x2 inverse channel matrix on the signal to compensate for chamber effects.

Enter the four inverse matrix values, see [Complex Matrix Elements \(Real/Imag\)](#).

Remote command:

[\[:SOURce<hw>\]:FSIMulator:MIMO:ANTenna:INVerse:MATRix:STATE](#)  
on page 217

### Complex Matrix Elements (Real/Imag)

Sets the 4 complex elements ( $h_{00}$ ,  $h_{01}$ ,  $h_{10}$ ,  $h_{11}$ ) of the inverse channel matrix.

$$\begin{bmatrix} A_{out} \\ B_{out} \end{bmatrix} = \begin{bmatrix} h_{00} & h_{01} \\ h_{10} & h_{11} \end{bmatrix} \begin{bmatrix} A_{in} \\ B_{in} \end{bmatrix}$$

$A_{in}$ ,  $B_{in}$  = Faded channel signals

$A_{out}$ ,  $B_{out}$  = Output signal of the channel emulator

The supported matrix size is 2x2.

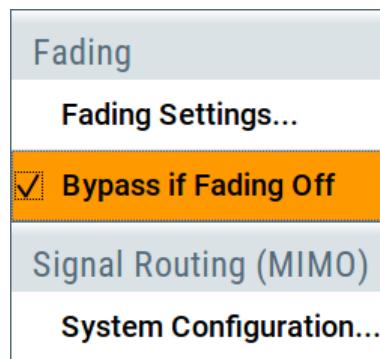

Remote command:

[\[:SOURce<hw>\]:FSIMulator:MIMO:ANTenna:INVerse:MATRix:ROW<st>:COLumn<ch>:REAL](#) on page 217  
[\[:SOURce<hw>\]:FSIMulator:MIMO:ANTenna:INVerse:MATRix:ROW<st>:COLumn<ch>:IMAGin](#) on page 217

## 5.4 Bypassing a deactivated fading simulator

To access this setting, proceed as follows:

1. Enable "Fading > Signal Routing (MIMO) > System Configuration > Mode > Advanced".
2. Select "Fading > Off".
3. Select "Fading > Bypass if Fading Off > On".

The fading simulator is disabled and the input basebands bypass it.

### Impact of the parameter on the calculation of the output streams

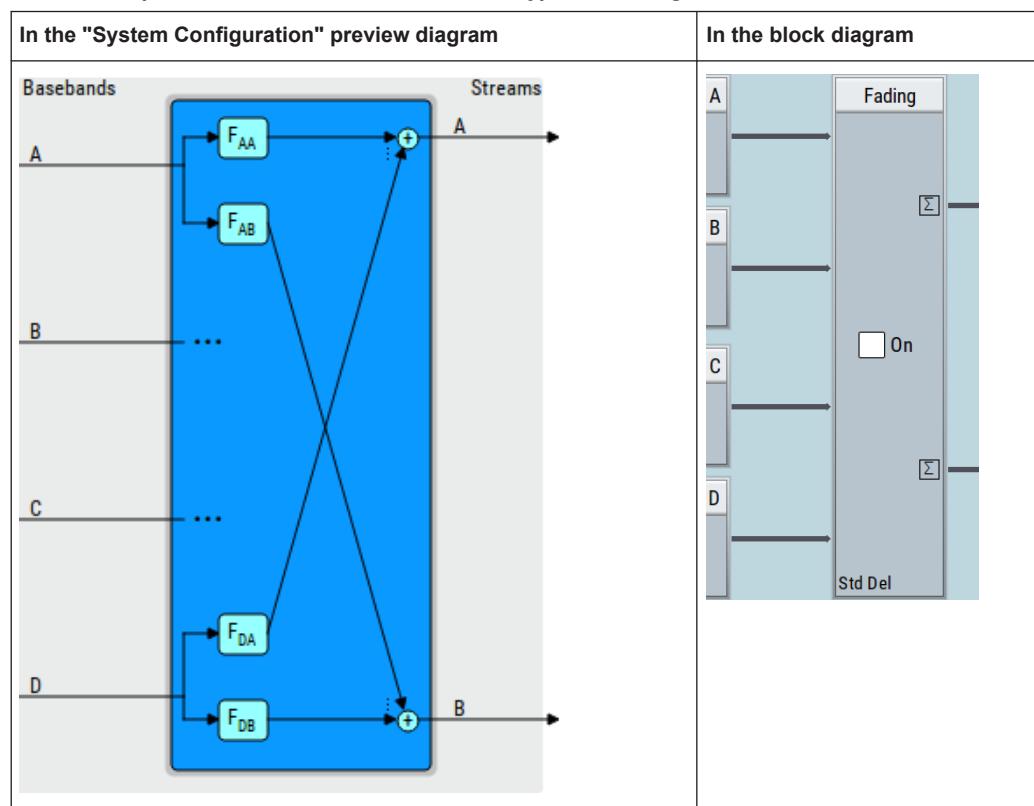

The parameter determines the way the output streams are calculated, if the fading simulator is disabled:

- Disabled parameter "Bypass if Fading Off" (default state)  
The fading simulator itself is disabled, but each output stream is still the linear combination of the input baseband signals and depend on the current MIMO configuration.

#### Example:

In a 4x2 MIMO system, for instance, the two output streams A and B are calculated from all the four input basebands. This instrument state is indicated by the sum symbols  $\Sigma$  at each output streams.

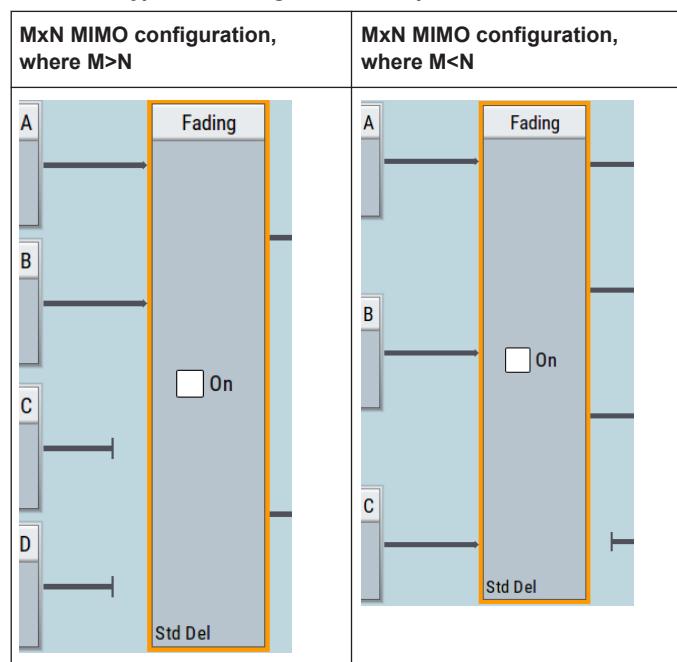

*Table 5-3: Representation of the instrument state Bypass Off > Off*

- Enabled parameter "Bypass if Fading Off"  
Bypasses the "Fading" block, i.e. the fading simulator is disabled and the basebands bypass unchanged the fading block.  
Depending on the MIMO configuration, the block diagram visualizes this behavior different (see [Table 5-4](#)). The absence of the sum symbols confirms the selection, too.

**Example:**

- In a 4x2 MIMO system, for instance, the two output streams A and B are identical to the two input baseband signals A and B.  
The basebands C and D are not processed.
- Vice versa, in a 3x4 MIMO system, the three output streams A, B and C are identical to the three basebands.  
The stream D is a zero stream that starts after the "Fading" block.

**Table 5-4: Bypass if Fading Off > On: Representation in the block diagram****"Bypass if Fading Off > ON" during troubleshooting**

While performing troubleshooting, enable this parameter to exclude the impact of the fading in the signal processing.

SCPI command:

[ :SOURce] :FSIMulator:BYPass:STATE on page 151

## 6 Remote-control commands

This subsystem contains the commands necessary to configure the fading simulator in a remote environment. We assume that the R&S SMW has already been set up for remote operation in a network as described in the R&S SMW documentation. A knowledge about the remote control operation and the SCPI command syntax are assumed.

### Conventions used in SCPI command descriptions

For a description of the conventions used in the remote command descriptions, see section "Remote Control Commands" in the R&S SMW user manual.

#### Required Options

All SCPI commands described in this section, require at least the R&S SMW-B14 option. For better overview, this option is not listed at each command. Also required options, however, are listed.

The dynamic fading configurations (Birth Death, Moving Propagation, 2 Channel Interferer and High-Speed Train) are available with option R&S SMW-K71.

See also [Chapter 2.1, "Required options", on page 18](#).

#### Common Suffixes

The following common suffixes are used in remote commands:

Suffix	Value range	Description
ENTity<ch>	1 to 8	Entity in a multiple entity configuration ENTity3 4 5 6 7 8 require option R&S SMW-K76
SOURce<hw>	[1] 2 to 8	Available faders SOURce3 4 5 6 7 8 require option R&S SMW-K76 Only SOURce1 possible, if the keyword ENTity is used
GROup<st>	[1] 2 to 4	Available fading path groups
PATH<ch>	[1] 2 to 5	Available fading paths
TAP<ch>	[1] to 10	Available MIMO taps
RAY<st>	[1] to 6	Available TGn clusters/rays
CLUStter<ch>	[1] to 20	Available SCME/WIMMER clusters

### Using SCPI command aliases for advanced mode with multiple entities

You can address multiple entities configurations by using the SCPI commands starting with the keyword `SOURCE` or the alias commands starting with the keyword `ENTity`.

Note that the meaning of the keyword `SOURce<hw>` changes in the second case.

For details, see section "SCPI Command Aliases for Advanced Mode with Multiple Entities" in the R&S SMW user manual.

## Programming examples

This description provides simple programming examples. The purpose of the examples is to present **all** commands for a given task. In real applications, one would rather reduce the examples to an appropriate subset of commands.

The programming examples have been tested with a software tool which provides an environment for the development and execution of remote tests. To keep the example as simple as possible, only the "clean" SCPI syntax elements are reported. Non-executable command lines (e.g. comments) start with two // characters.

At the beginning of the most remote control program, an instrument preset or reset is recommended to set the instrument to a definite state. The commands \*RST and SYSTem:PRESet are equivalent for this purpose. \*CLS also resets the status registers and clears the output buffer.

The following commands specific to the fading simulator are described here:

● General settings.....	150
● Delay modes.....	172
● Birth death.....	183
● High-speed train.....	187
● Moving propagation.....	192
● MIMO settings.....	197
● TGn settings.....	205
● SCME/WINNER and antenna model settings.....	208
● Two channel interferer.....	218
● Custom fading profile.....	222
● SCM fading profile.....	224
● Customized dynamic fading.....	236
● Fading bandwidth.....	240

---

[:SOURce]:FSIMulator:BYPass:STATe <BypState>

Enables/disables bypassing of the fading simulator if the simulator is deactivated.

**Parameters:**

<BypState>	1   ON   0   OFF
*RST:	0

---

[:SOURce<hw>]:FSIMulator:CONFIGuration <Configuration>

Selects the fading configuration.

To activate the selected fading configuration, use the command for switching the state.

**Parameters:**

<Configuration>	STANDARD   BIRTHdeath   MDELay   TCInterferer   HSTRain   CDYNAMIC
-----------------	--

Defines the configuration: Standard delay, birth death propagation, moving propagation, two channel interferer, high-speed train and customized dynamic fading propagation.

\*RST: STANDARD

**Example:** SOURce1:FSIMulator:CONFIGuration MDELay  
 SOURce1:FSIMulator:MDELay:STATe ON  
 Selects and activates the moving propagation configuration

**Options:** BIRTHdeath|MDELay|TCInterferer|HSTRain require R&S SMW-K71  
 CDYNAMIC requires R&S SMW-K820

**Manual operation:** See "Configuration" on page 31

---

[:SOURce<hw>]:FSIMulator:SISO:COPY <CopyToDest>

In "System Configurations" with multiple entities ( $L > 2$ ), copies the settings of the current fading simulator to all or to the selected entities.

**Parameters:**

<CopyToDest> FADB | FADA | FADC | FADD | FADF | FADE | FADG | FADH |  
ALL  
\*RST: ALL

**Example:** SOURcel:FSIMulator:SISO:COPY ALL

**Options:** R&S SMW-K76

**Manual operation:** See "[Copy To / Entity](#)" on page 30

---

[:SOURce<hw>]:FSIMulator:COPY:DESTination <Destination>

Selects a group whose settings will be overwritten.

**Parameters:**

<Destination> integer  
Range: 1 to 4 (Standard Delay)/ 8 (Fine Delay)  
\*RST: 2

**Example:** See [:SOURce<hw>]:FSIMulator:COPY:SOURce on page 152

**Manual operation:** See "[To](#)" on page 48

---

[:SOURce<hw>]:FSIMulator:COPY:EXECute

Copies the settings of a fading path group to the selected one.

**Example:** See [:SOURce<hw>]:FSIMulator:COPY:SOURce on page 152

**Usage:** Event

**Manual operation:** See "[Copy](#)" on page 48

---

[:SOURce<hw>]:FSIMulator:COPY:SOURce <Source>

Sets the group whose settings are to be copied.

**Parameters:**

<Source> integer  
Range: 1 to 8  
\*RST: 1

**Example:**

```
FSIM:DEL:STAT ON
FSIM:COPY:DEST 4
FSIM:COPY:SOUR 1
FSIM:COPY:EXEC
// copies the settings from group 1 to group 4
```

**Manual operation:** See "[Copy Path Group](#)" on page 47

### [**:SOURce<hw>]:FSIMulator:FREQuency <Frequency>**

- If [**:SOURCE<hw>]:FSIMulator:SDESTination RF** is selected, queries the estimated RF frequency.
- If [**:SOURCE<hw>]:FSIMulator:SDESTination BB** is selected, sets the frequency used for the calculation of the Doppler shift.

**Parameters:**

<Frequency>	float
	Range: 1E5 to 100E9
	Increment: 0.01
	*RST: 1E9
	Default unit: Hz

**Example:**

```
SOURcel:FSIMulator:SDESTination RF
SOURcel:FSIMulator:FREQuency?

SOURcel:FSIMulator:SDESTination BB
SOURcel:FSIMulator:FREQuency 2143200000
```

**Manual operation:** See "[Dedicated Frequency](#)" on page 37  
See "[Virtual RF](#)" on page 37

### [**:SOURce<hw>]:FSIMulator:CLOCk:RATE?**

Queries the clock rate the fading simulator is using for the signal processing.

**Return values:**

<ClockRate>	CR200   CR100   CR050   CR025   CR250   CR125   CR062   CR500   CR1G
	CR200 = 200 MHz, CR100 = 100 MHz, CR050 = 50 MHz, CR025 = 25 MHz
	CR250 = 250 MHz, CR125 = 125 MHz, CR062 = 62.5 MHz, CR500 = 500 MHz, CR1G = 1GHz
	The value depends on the selected "System Configuration" and influences the bandwidth of the generated signal.

\*RST: depends on the installed options\*

\* CR200M (R&S SMW-B10)/CR250M (R&S SMW-B9)

**Usage:** Query only

**Options:** CR250|CR125|CR062|CR500|CR1G require R&S SMW-B9/B15

**Manual operation:** See "[Fading Clock Rate](#)" on page 34

---

[:SOURce<hw>]:FSIMulator:GLOBal:SEED <Seed>

This command enters the fading start seed. This value is global for the instrument.

**Parameters:**

<Seed>	integer
	Range: 0 to 9
	*RST: 0

**Example:**

FSIM:GLOB:SEED 2

Sets the start seed to 2

**Manual operation:** See "[Start Seed](#)" on page 44

---

[:SOURce<hw>]:FSIMulator:HOPPing:MODE <Mode>

This is a password-protected function. Unlock the protection level 1 to access it.

Activates frequency hopping and determines how fading is resumed after a frequency hop.

**Note:** Activate list mode and load the frequency table before activating frequency hopping.

**Parameters:**

<Mode>	OFF   IBAND   OOBand
	<b>OFF</b>
	Frequency hopping is deactivated.
	<b>IBAND</b>
	Activates an in-band frequency hopping.
	<b>OOBand</b>
	Activates an out of band frequency hopping.
	*RST: OFF

**Example:**

FSIM:HOPP:MODE OFF

**Manual operation:** See "[Freq. Hopping](#)" on page 38

---

[:SOURce<hw>]:FSIMulator:IGNore:RFCHanges <RfChanges>

This is a password-protected function. Unlock the protection level 1 to access it.

Sets if frequency changes < 5% are ignored. This enables faster frequency hopping.

**Parameters:**

<RfChanges>	1   ON   0   OFF
	*RST: 0

**Example:**

FSIM:IGN:RFCH ON

Ignores frequency changes < 5% for the fading.

**Manual operation:** See "[Ignore RF Changes < 5PCT](#)" on page 37

---

**[:SOURce<hw>]:FSIMulator:ILOSs:CSAMPles?**

This command queries the share of samples which were clipped due to the insertion loss setting.

**Return values:**

<CSamples> string

**Example:**

FSIM:ILOS:CSAM?

Queries the share of samples which were clipped.

Response: 11

11% of the samples were clipped.

**Usage:**

Query only

**Manual operation:** See "[Clipped Samples](#)" on page 43

---

**[:SOURce<hw>]:FSIMulator:ILOSs:MODE <Mode>**

This command sets the insertion loss of the fading simulator.

**Parameters:**

<Mode> NORMAl | LACP | USER

**NORMAl**

The minimum insertion loss for a path of the fading simulator is set to a fixed value of 18 dB.

\*RST: NORMAl

**Example:**

FSIM:ILOS:MODE USER

Chooses the user-defined setting for the insertion loss.

FSIM:ILOS 4 dB

sets the minimum insertion loss to 4 dB.

**Manual operation:** See "[Insertion Loss Mode](#)" on page 42

---

**[:SOURce<hw>]:FSIMulator:ILOSs[:LOSS] <Loss>**

This command sets the user-defined insertion loss of the fading simulator when "User" is selected.

In the "Normal" and "Low ACP" modes, the current setting of the value can be queried.

**Parameters:**

<Loss> float

Range: -3 to 30

Increment: 0.1

\*RST: 0

Default unit: dB

**Example:**

FSIM:ILOS:MODE USER

Chooses the user-defined setting for the insertion loss.

FSIM:ILOS 4 dB

sets the minimum insertion loss to 4 dB.

**Manual operation:** See "[Insertion Loss](#)" on page 43

---

**[`:SOURce<hw>]:FSIMulator:KCONstant <KConstant>`**

Selects whether to keep the speed or the resulting Doppler shift constant in case of frequency changes.

**Parameters:**

<KConstant>      SPEed | DSHift  
                      \*RST:      SPEed

**Example:**

`FSIM:KCON SPE`

Keeps the speed constant in case of frequency changes.

**Manual operation:** See "[Keep Constant](#)" on page 47

---

**[`:SOURce<hw>]:FSIMulator:PRESet`**

Sets the default settings (\*RST values) for fading simulation.

**Example:**      `SOURce1:FSIMulator:PRESet`

**Usage:**      Event

**Manual operation:** See "[Set to Default](#)" on page 30

---

**[`:SOURce<hw>]:FSIMulator:REStart:MODE <Mode>`**

Selects how a restart of fading simulation is triggered.

**Parameters:**

<Mode>      AUTO | BBTRigger | AAUT  
**BBTRigger**  
                    Restarts the fading process synchronously with received baseband trigger signal.  
**AAUT**  
                    Not supported in the current version.  
                     \*RST:      AUTO

**Manual operation:** See "[Mode](#)" on page 38

---

**[`:SOURce<hw>]:FSIMulator:ROUTE <Route>`**

Selects on which baseband path the faded signal is output. The input signal of the fader is selected with command `SOURce : BB : ROUTe`.

For one-path instruments this command is query only. It returns value FAA (Fader A always outputs the signal on baseband A).

**Note:** All MIMO configurations are enabled only in : SConfiguration:MODE ADVanced.

**FAA**

The faded modulation signal of fader A is placed on baseband path A.

**FAAFBB**

The faded modulation signal of fader A is placed on baseband path A and the faded modulation signal of fader B is placed on baseband path B.

**FAAFBA**

The faded modulation signal of fader A and B is placed on baseband path A.

**FABFBB**

The faded modulation signal of fader A and B is placed on baseband path B.

**FAABFBAB**

The faded modulation signal of fader A and B is placed on baseband paths A and B.

**FAMAXA**

The faded modulation signal of fader A is placed on baseband path A.

**FBMAXB**

The faded modulation signal of fader B is placed on baseband path B.

**FAMAXAB**

The faded modulation signal of fader A is placed on baseband paths A and B.

**FBMAXAB**

The faded modulation signal of fader B is placed on baseband paths A and B.

**FA1A2BFB1A2B|FA1A2BFB1A2BM22| ... |FAAFBB811**

Sets a MIMO mode

**Example:**

```
SOURce1:FSIMulator:MIMO:CAPability?  
// "M2X2,M2X4,M4X2,M2X3,M3X2,M1X2,..."  
SOURce1:FSIMulator:ROUTE FA1A2BFB1A2BM24  
// selects a 1x2X4 MIMO configuration
```

**Options:**

See data sheet.

**Manual operation:** See "[Signal Routing](#)" on page 91

---

**[:SOURce]:FSIMulator:SYNChronize:STATe <State>**

Couples the fading simulators so that if both blocks are active, a subsequent restart event in any of them causes a simultaneous restart of the other.

Restart event can be caused by a start/stop alternation or a parameter change that results in a signal recalculation and therefore a process restart.

**Parameters:**

<State>            1 | ON | 0 | OFF  
                       \*RST:        0

**Example:**

```
SOURce1:FSIMulator:STATE 1
SOURce2:FSIMulator:STATE 1
SOURce:FSIMulator:SYNChronize:STATE 1
SOURce1:FSIMulator:STATE 0
SOURce2:FSIMulator:STATE 1
// the fading simulators restart simultaneously
```

**Manual operation:** See "[Synchronization](#)" on page 39

**[:SOURce<hw>]:FSIMulator:SDESTination <SDestination>**

Defines the frequency to that the signal of the whole Fader block is dedicated.

**Parameters:**

<SDestination>    RF | BB

**RF**

The Doppler shift is calculated based on the actual RF frequency, that is *dynamically estimated*.

To query the estimated dedicated frequency, use the command [\[:SOURce<hw>\]:FSIMulator:FREQuency](#).

To query the output connector, use the command [\[:SOURce<hw>\]:FSIMulator:FREQuency:DETect?](#) on page 160.

**BB**

Set the fader frequency *manually* by means of the command [\[:SOURce<hw>\]:FSIMulator:FREQuency](#).

\*RST:        RF

**Example:** See [\[:SOURce<hw>\]:FSIMulator:FREQuency](#) on page 153

**Manual operation:** See "[Signal Dedicated To](#)" on page 34

**[:SOURce<hw>]:FSIMulator:FREQuency:DETect?**

Queries the output interface the steam used to estimate the dedicated frequency is mapped to.

**Return values:**

<DetectPrimary>    RFA | BBMM1 | RFB | BBMM2 | IQOUT1 | IQOUT2 | FAD1 |  
                       FAD2 | FAD4 | FAD3 | DEF

**Example:**

:SOURcel:FSIMulator:FREQ:DETect?

**Usage:**            Query only

**Manual operation:** See "[Dedicated Connector](#)" on page 37

**[**:SOURce<hw>]:FSIMulator:SPEed:UNIT <Unit>****

This command chooses the default unit for the parameter speed as displayed in the dialog.

**Note:** The remote control command changes only the units displayed in the graphical user interface. While configuring the speed via remote control, the speed units must be specified.

**Parameters:**

<Unit> MPS | KMH | MPH | NMPH

\*RST: KMH

**Example:**

FSIM:SPE:UNIT MPS

Sets meters per second as the default unit for the speed parameter as displayed in the graphical user interface.

**Manual operation:** See "[Speed Unit](#)" on page 47

**[**:SOURce<hw>]:FSIMulator:STANDard <Standard>****

Selects a predefined fading simulator setting which complies with the test specifications found in the common mobile radio standards.

For a detailed summary of all the default settings, see [Chapter A, "Predefined fading settings"](#), on page 242.

Standard/test case	<Predefined_Standard>	Description
-	USER	USER parameter cannot be set. A query returns this value if a user-defined Fading setting was loaded or if one of the associated settings was changed after the selection of a standard

\*RST: USER

**Example:** FSIM:STAN THT

**Manual operation:** See "[Standard / Test Case](#)" on page 31

**Option:** see the corresponding section in [Chapter A, "Predefined fading settings"](#), on page 242.

**[:SOURce<hw>]:FSIMulator:STANDARD:REFERENCE <Reference>**

Queries the reference in the standard for the selected test case.

**Parameters:**

<Reference> string

**Example:**

```
FSIM:STAN WC1BUP2
// Selects settings in acc. with 3GPP FDD Test Case 1 (2 fading paths)
FSIM:STAN:REF?
// "3GPP TS 25.101 V6.2.0 (2003-09), annex B2.2"
```

**Manual operation:** See "[Standard / Test Case](#)" on page 31

### [**:SOURce<hw>]:FSIMulator[:STATe]** <State>

Activates fading simulation.

**Parameters:**

<State>	1   ON   0   OFF
	*RST: 0

**Example:** Option: R&S SMW-B14

```
FSIM ON
// Activates fading simulation
```

**Example:** Option: R&S SMW-B15

```
SCONfiguration:MODE ADV
SCONfiguration:APPLY
FSIM ON
// Activates fading simulation
```

**Manual operation:** See "["State"](#) on page 30

See "["State Path"](#) on page 48

### [**:SOURce**]:FSIMulator:CATalog?

Queries the files with settings in the default directory. Listed are files with the file extension \*.fad.

**Return values:**

<FileNames>	<filename1>,<filename2>,...
	Returns a string of filenames separated by commas.

**Example:**

```
SOURcel:FSIMulator:STORE "/var/user/delay_3gpp"
*RST
SOURcel:FSIMulator:CATalog?
// Birth_3gpp, delay_3gpp, fad_test
SOURcel:FSIMulator:LOAD "/var/user/fad_test"
SOURcel:FSIMulator:STATE 1
SOURcel:FSIMulator:DELETE "Birth_3gpp"
```

**Usage:** Query only

**Manual operation:** See "[Save/Recall](#)" on page 31

---

**[:SOURce<hw>]:FSIMulator:LOAD <Filename>**

Loads the selected file from the default or the specified directory. Loaded are files with extension \*.fad.

**Setting parameters:**

<Filename>            "<filename>"  
                          Filename or complete file path; file extension can be omitted

**Example:**            See [\[:SOURce\]:FSIMulator:CATalog?](#) on page 169.

**Usage:**              Setting only

**Manual operation:** See "Save/Recall" on page 31

---

**[:SOURce]:FSIMulator:DELETE <Filename>**

Deletes the specified file containing a fading setting from the default directory. The default directory is set with the command MMEM:CDIRectory. A path can also be specified. Only files with the file ending \*.fad are deleted.

**Note:** This command is only valid with DELETE in the long form as DEL is used as short form of header keyword DELay.

**Setting parameters:**

<Filename>            string

**Example:**            See [\[:SOURce\]:FSIMulator:CATalog?](#) on page 169

**Usage:**              Setting only

**Manual operation:** See "Save/Recall" on page 31

---

**[:SOURce<hw>]:FSIMulator:STORe <Filename>**

Saves the current settings into the selected file; the file extension (\*.fad) is assigned automatically.

**Setting parameters:**

<Filename>            "<filename>"  
                          Filename or complete file path

**Example:**            See [\[:SOURce\]:FSIMulator:CATalog?](#) on page 169.

**Usage:**              Setting only

**Manual operation:** See "Save/Recall" on page 31

---

**[:SOURce<hw>]:FSIMulator:COUPle:LOGNormal:CSTD <Cstd>****[:SOURce<hw>]:FSIMulator:COUPle:LOGNormal:LCONSTant <LConstant>**

(available in "System Configuration > Mode > Standard")

Couples the lognormal fading setting.

**Parameters:**

<LConstant>      1 | ON | 0 | OFF  
                       \*RST:        0

**Example:**

```
SCONfiguration:MODE STANdard

SOURce1:FSIMulator:CONFIGuration STAN
SOURce1:FSIMulator:DEL:GROup1:PATH1:PROFile PDOP
SOURce1:FSIMulator:DEL:GROup1:PATH1:SPEEd 1111.111
SOURce1:FSIMulator:STATe 1
SOURce1:FSIMulator:COUple:SPEEd 1
SOURce1:FSIMulator:CSPEed 1

SOURce2:FSIMulator:CONFIGuration STAN
SOURce2:FSIMulator:STATe 1
SOURce2:FSIMulator:DEL:GROup1:PATH1:SPEEd?
// 1111.111

SOURce1:FSIMulator:COUple:LOGNormal:LCONSTant 1
SOURce1:FSIMulator:COUple:LOGNormal:CSTD 1
SOURce1:FSIMulator:DEL:GROup1:PATH1:LOGNormal:STATe 1
SOURce1:FSIMulator:DEL:GROup1:PATH1:LOGNormal:LCONSTant 150
SOURce2:FSIMulator:DEL:GROup1:PATH1:LOGNormal:LCONSTant?
// 150
SOURce1:FSIMulator:DEL:GROup1:PATH1:LOGNormal:CSTD 2
SOURce2:FSIMulator:DEL:GROup1:PATH1:LOGNormal:CSTD?
// 2
```

**Manual operation:** See "[Local Constant Coupled](#)" on page 44

**[:SOURce<hw>]:FSIMulator:COUple:SPEEd <Speed>**

(available in "System Configuration > Mode > Standard")

Couples the setting for the speed for the paths of both faders.

**Parameters:**

<Speed>      1 | ON | 0 | OFF  
                       \*RST:        0

**Example:**

See [\[:SOURce<hw>\]:FSIMulator:COUple:LOGNormal:LCONSTant](#) on page 170

**Manual operation:** See "[Speed Setting Coupled](#)" on page 44

**[:SOURce<hw>]:FSIMulator:CSPEed <CSpeed>**

Determines whether the same speed is set for all of the activated fading paths.

**Parameters:**

<CSpeed>      1 | ON | 0 | OFF  
                       \*RST:        1

**Example:** See [:SOURce<hw>]:FSIMulator:COUPle:LOGNormal:LConstant on page 170

**Manual operation:** See "Common Speed For All Paths" on page 47

**[:SOURce<hw>]:FSIMulator:MDElay:DEL30:GROup<st>:PATH<ch>:ADElay**

<ADelay>

**[:SOURce<hw>]:FSIMulator:DELay|DEL:GROup<st>:PATH<ch>:ADElay**

<ADelay>

Sets the path-specific delay ("Additional Delay") of the selected path.

**Parameters:**

&lt;ADelay&gt;

float

Range: depends on the installed options\*

Increment: depends on the installed options\*

\*RST: 0

\*) See [Chapter 2.4, "Characteristics of R&S SMW-B14 and R&S SMW-B15", on page 25.](#)**Example:**

```
SOURcel:FSIMulator:CONFiguration STAN
SOURcel:FSIMulator:DEL:GROup2:PATH2:STATE 1
SOURcel:FSIMulator:DEL:GROup2:PATH2:ADElay 10E-6
// sets a delay of 10 us for path 2 of the fading group 2
```

**Manual operation:** See "[Additional Delay](#)" on page 51**[:SOURce<hw>]:FSIMulator:MDELay:DEL30:GROup<st>:PATH<ch>:BDElay**

&lt;BDelay&gt;

**[:SOURce<hw>]:FSIMulator:DELay|DEL:GROup<st>:PATH<ch>:BDElay**

&lt;BDelay&gt;

Sets the basic group delay.

**Parameters:**

&lt;BDelay&gt;

float

Range: depends on the installed options\*

Increment: depends on the installed options\*

\*RST: 0

\*) See [Chapter 2.4, "Characteristics of R&S SMW-B14 and R&S SMW-B15", on page 25.](#)**Example:**

```
SOURcel:FSIMulator:CONFiguration STAN
SOURcel:FSIMulator:DEL:GROup2:PATH2:STATE 1
SOURcel:FSIMulator:DEL:GROup2:PATH2:BDElay 1E-3
// sets a delay of 1 ms for path 2 of the fading group 2
```

**Options:**

R&amp;S SMW-B14

**Manual operation:** See "[Basic Delay](#)" on page 51**[:SOURce<hw>]:FSIMulator:MDELay:DEL30:GROup<st>:PATH<ch>:RDElay?****[:SOURce<hw>]:FSIMulator:DELay|DEL:GROup<st>:PATH<ch>:RDElay?**Queries the resulting delay of the paths for the selected fading configuration. The Resulting Delay is the sum of the Basic Delay (`SOURce:FSIM:...:BDElay`) and the Additional Delay (`SOURce:FSIM:...:ADElay`).

**Return values:**

<RDelay> float

Sum of the values set with the commands [:SOURce<hw>]:FSIMulator:DELay|DEL:GROup<st>:PATH<ch>:BDElay and [:SOURce<hw>]:FSIMulator:DELay|DEL:GROup<st>:PATH<ch>:ADElay.

Range: depends on the installed options\*

Increment: 10E-9

\*RST: 0

\*) See [Chapter 2.4, "Characteristics of R&S SMW-B14 and R&S SMW-B15", on page 25.](#)

**Example:**

```
SOURcel:FSIMulator:CONFIGuration STAN
SOURcel:FSIMulator:DEL:GROup2:PATH1:STATE 1
SOURcel:FSIMulator:DEL:GROup2:PATH2:BDElay 2E-4
// sets a delay of 200 us for the fading group 2
SOURcel:FSIMulator:DEL:GROup2:PATH2:ADElay 1E-5
// sets an additonal delay
SOURcel:FSIMulator:DEL:GROup2:PATH2:RDElay?
// 0.00021
```

**Usage:**

Query only

**Manual operation:** See "[Resulting Delay](#)" on page 51

**[:SOURce<hw>]:FSIMulator:DELay|DEL:GROup<st>:PATH<ch>:CORRelation:COEFFicient <Coefficient>**

Determines the magnitude of the complex correlation coefficient. The higher the entered percentage, the greater the correlation of the statistical fading processes for the two paths. Highly correlated ambient conditions for the signal are simulated in this manner.

Sets the correlation coefficient of the correlated path of the second fader also to the entered value.

**Parameters:**

<Coefficient> float

Range: 0 to 100

Increment: 0.1

\*RST: 100

Default unit: PCT

**Example:**

```
FSIM:DEL:STAT ON
```

Activates the "Standard Delay" fading configuration.

```
FSIM:DEL:GRO2:PATH:CORR:STAT ON
```

switches on the correlation of fading path 1 of group 2 of fader A to fading path 1 of group 2 of fader B.

```
FSIM:DEL:GRO2:PATH:CORR:COEF 95
```

specifies a correlation coefficient of 95% for the two paths.

**Manual operation:** See "[Correlation Coefficient](#)" on page 55

---

**[:SOURce<hw>]:FSIMulator:DELay|DEL:GROup<st>:PATH<ch>:CORRelation:  
PHASe <Phase>**

Determines the phase of the complex correlation coefficient.

Sets the phase of the correlation coefficient of the correlated path of the second fader also to the entered value.

**Parameters:**

<Phase>

float

Range: 0 to 359.9

Increment: 0.05

\*RST: 0

Default unit: DEG

**Example:**

FSIM:DEL:STAT ON

Activates the "Standard Delay" fading configuration.

FSIM:DEL:GRO2:PATH:CORR:STAT ON

switches on the correlation of fading path 1 of group 2 of fader A to fading path 1 of group 2 of fader B.

FSIM:DEL:GRO2:PATH:CORR:PHAS 5

specifies a phase of the correlation coefficient equal to 5 DEG for the two paths.

**Manual operation:** See "[Correlation Coefficient Phase](#)" on page 55

---

**[:SOURce<hw>]:FSIMulator:DELay|DEL:GROup<st>:PATH<ch>:CORRelation:  
STATe <State>**

Enables correlation of the paths of the first fader. The suffix in SOURCE defines the fader on which path settings the correlation is based.

When correlation is activated, the settings of the correlation parameters, the profile, the speed and the lognormal parameters are the same for both paths.

**Parameters:**

<State>

1 | ON | 0 | OFF

\*RST: 0

**Example:**

SOURCE1:FSIMulator:DELay:STATE ON

SOURCE1:FSIMulator:DELay:GROup2:PATH1:

CORRelation:STATE ON

Enables correlation of fading path 1 of group 2 of fader A to fading path 1 of group 2 of fader B.

**Manual operation:** See "[Correlation Path](#)" on page 54

---

**[:SOURce<hw>]:FSIMulator:DELay|DEL:GROup<st>:PATH<ch>:CPHase  
<CPhase>**

Sets the start phase rotation.

**Parameters:**

&lt;CPhase&gt;

float

Range: 0 to 359.9

Increment: 0.1

\*RST: 0

Default unit: DEG

**Example:**

FSIM:DEL:STAT ON

Activates the Standard Delay fading configuration.

FSIM:DEL:GRO1:PATH1:PROF RICE

selects the Rice fading profile for fading path 1 of group 1.

FSIM:DEL:GRO1:PATH:CPH 5DEG

sets a start phase rotation of 5 DEG for fading path 1 of group 2.

The path is multiplied by this phase.

**Manual operation:** See "[Const. Phase](#)" on page 52See "[Start Phase](#)" on page 52

```
[:SOURce<hw>]:FSIMulator:MDELay:DEL30:GROup<st>:PATH<ch>:FDOPpler
    <FDoppler>
[:SOURce<hw>]:FSIMulator:DELay|DEL:GROup<st>:PATH<ch>:FDOPpler[:]
    RESulting] <FDoppler>
```

Queries the resulting Doppler frequency for the fading configuration.

The Doppler frequency is determined by the selected speed ([\[:SOURce<hw>\]:FSIMulator:DELay|DEL:GROup<st>:PATH<ch>:SPEed\]](#)).

For the Pure Doppler and Rice Fading profiles, the actual Doppler shift is a function of the selected ratio of the Doppler shift to the Doppler frequency ([\[:SOURce<hw>\]:FSIMulator:DELay|DEL:GROUP<st>:PATH<ch>:FRATio\]](#)). Use the command [\[:SOURce<hw>\]:FSIMulator:DELay|DEL:GROup<st>:PATH<ch>:FDOPpler:ACTual?](#) to query the actual Doppler shift.

**Parameters:**

<FDoppler> float  
 Range: 0 to max\*  
 Increment: 0.01  
 \*RST: 0  
 Default unit: Hz  
 \*) Option:  
 R&S SMW-B14 max = 4000  
 R&S SMW-B15 max depends on the System Configuration  
 LxMxN and profile as follows:  
 Lx1x1 with L = 1 to 8: max = 4000  
 1x2x2/2x2x2/2x2x1/2x1x2/3x2x2/4x2x2/1x2x4/1x4x2: max = 4000  
 1x2x8/1x8x2/1x4x4/2x4x4/2x2x4: max = 2000  
 1x8x4/1x4x8/2x4x4: max = 600  
 1x8x8 (subset 1 or 2): max = 300 (R&S SMW-K821)  
 1x8x8 (all subsets): max = 150 (R&S SMW-B15/K75)  
`[ :SOURce<hw>]:FSIMulator:DELay|DEL:GROup<st>:PATH<ch>:PROFile BELLindoor|BELVehicle: max = 50`

**Example:**

```
SOURcel:FSIMulator:CONFiguration STAN
SOURcel:FSIMulator:DEL:GROup1:PATH1:PROFile RICE
SOURcel:FSIMulator:DEL:GROup1:PATH1:FRATio 1
SOURcel:FSIMulator:DEL:GROup1:PATH1:FDOPler:RESulting?
// Response: 2.77968967451476
// set a frequency ratio for the first fading path of group 1.
// I.e. set an angle of incidence of about 45° with respect to
// a receiver that is going away from the transmitter
SOURcel:FSIMulator:DEL:GROup1:PATH1:FRATio -0.71
SOURcel:FSIMulator:DEL:GROup1:PATH1:FDOPler:RESulting?
// Response: 2.77968967451476
SOURcel:FSIMulator:DELay:GROup1:PATH1:FDOPler:ACTual?
// Response: -1.97
```

**Manual operation:** See "[Resulting Doppler Shift](#)" on page 53

`[ :SOURce<hw>]:FSIMulator:MDELay:DEL30:GROup<st>:PATH<ch>:FDOPler:ACTual?`  
`[ :SOURce<hw>]:FSIMulator:DELay|DEL:GROup<st>:PATH<ch>:FDOPler:ACTual?`

Queries the actual Doppler shift.

For the Pure Doppler and Rice Fading profiles, the actual Doppler shift is a function of the selected ratio of the Doppler shift to the Doppler frequency (`[ :SOURce<hw>]:FSIMulator:DELay|DEL:GROup<st>:PATH<ch>:FRATio`).

**Return values:**

<ActDoppler> float  
 Range: -4000.0 to 4000  
 Increment: 0.01  
 \*RST: 0

**Example:**

See [:SOURce<hw>]:FSIMulator:DELay|DEL:  
 GROup<st>:PATH<ch>:FDOPpler[:RESulting]  
 on page 176

**Usage:**

Query only

**Manual operation:** See "Actual Doppler Shift" on page 54

[:SOURce<hw>]:FSIMulator:MDElay:DEL30:GROup<st>:PATH<ch>:FRATio  
 <FRatio>

[:SOURce<hw>]:FSIMulator:DELay|DEL:GROup<st>:PATH<ch>:FRATio <FRatio>

For Rice, pure Doppler and Gauss Doppler fading, sets the ratio of the actual Doppler frequency to the set Doppler frequency. The Frequency Ratio serves as a measure of the angle of incidence between the transmitter and receiver.

**Parameters:**

<FRatio> float  
 Range: -1 to 1  
 Increment: 0.0001  
 \*RST: 0

**Example:**

See [:SOURce<hw>]:FSIMulator:DELay|DEL:  
 GROup<st>:PATH<ch>:FDOPpler[:RESulting]  
 on page 176

**Manual operation:** See "Frequency Ratio" on page 53

[:SOURce<hw>]:FSIMulator:DELay|DEL:GROup<st>:PATH<ch>:FSHift <FShift>

Sets the frequency shift for the Gauss Watterson fading.

**Parameters:**

<FShift> float  
 Range: -10 to 10  
 Increment: 0.0001  
 \*RST: 0

**Example:**

FSIM:DEL:GRO:PATH2:PROF WATT  
 FSIM:DEL:GRO:PATH2:FS?

**Manual operation:** See "Frequency Shift" on page 52

---

```
[:SOURce<hw>]:FSIMulator:DELay|DEL:GROup<st>:PATH<ch>:FSPRead
    <FSpread>
```

Sets the frequency spread for the Gauss Watterson fading.

**Parameters:**

<FSpread>	float
	Range: 1E-4 to 30
	Increment: 1E-4
	*RST: 0.1

**Example:** FSIM:DEL:GRO:PATH2:PROF WATT  
FSIM:DEL:GRO:PATH2:FSPR?

**Manual operation:** See "[Frequency Spread](#)" on page 51

---

```
[:SOURce<hw>]:FSIMulator:DELay|DEL:GROup<st>:PATH<ch>:LOGNormal:
    CSTD <Cstd>
```

Sets the standard deviation for lognormal fading.

**Parameters:**

<Cstd>	integer
	Range: 0 to 12
	*RST: 0
	Default unit: dB

**Example:** FSIM:DEL:STAT ON  
Activates the Standard Delay fading configuration.  
FSIM:DEL:GRO:PATH2:LOGN:STAT ON  
selects lognormal fading for fading path 2 of group 1.  
FSIM:DEL:GRO:PATH2:LOGN:CSTD 2  
sets a standard deviation of 2 dB for fading path 2 of group 1.

**Manual operation:** See "[Standard Deviation](#)" on page 56

---

```
[:SOURce<hw>]:FSIMulator:DELay|DEL:GROup<st>:PATH<ch>:LOGNormal:
    LCONstant <LConstant>
```

Sets the Local Constant for lognormal fading.

**Parameters:**

<LConstant>	float
	Range: 0 to 200
	Increment: 0.1
	*RST: 100
	Default unit: m

**Example:** FSIM:DEL:STAT ON  
 Activates the Standard Delay fading configuration.  
 FSIM:DEL:GRO:PATH2:LOGN:STAT ON  
 selects lognormal fading for fading path 2 of group 1.  
 FSIM:DEL:GRO:PATH2:LOGN:LCON 100  
 sets a Local Constant of 100 m for the second fading path of group 1.

**Manual operation:** See "[Local Constant](#)" on page 55

**[:SOURce<hw>]:FSIMulator:DELay|DEL:GROup<st>:PATH<ch>:LOGNormal:STATe <State>**

Enables/ disables a lognormal fading.

**Parameters:**

<State>	1   ON   0   OFF
	*RST: 0

**Example:** FSIM:DEL:STAT ON  
 Activates the "Standard Delay" fading configuration.  
 FSIM:DEL:GRO:PATH2:LOGN:STAT ON  
 activates lognormal fading for fading path 2 of group 1.

**Manual operation:** See "[Lognormal State](#)" on page 55

**[:SOURce<hw>]:FSIMulator:MDELay:DEL30:GROup<st>:PATH<ch>:LOSS <Loss>**  
**[:SOURce<hw>]:FSIMulator:DELay|DEL:GROup<st>:PATH<ch>:LOSS <Loss>**

Sets the loss of the paths.

**Parameters:**

<Loss>	float
	Range: 0 to 50
	Increment: 0.001
	*RST: 10 0
	Default unit: dB

**Example:** FSIM:DEL:STAT ON  
 Activates the "Standard Delay" fading configuration.  
 FSIM:DEL:GRO:PATH2:LOSS 2 dB  
 sets a loss of 2 dB for fading path 2 of group 1.

**Manual operation:** See "[Path Loss](#)" on page 50

**[:SOURce<hw>]:FSIMulator:DELay|DEL:GROup<st>:PATH<ch>:PRATio <PRatio>**

Sets the power ratio of the discrete and distributed components for Rice fading  
 (:SOURce:FSIMulator:DELay:GROup:PATH2:PROFile RICE).

**Parameters:**

<PRatio> float  
 Range: -30 to 30  
 Increment: 0.01  
 \*RST: 0  
 Default unit: dB

**Example:**

```
FSIM:DEL:STAT ON
Activates the "Standard Delay" fading configuration.
FSIM:DEL:GRO:PATH2:PROF RICE
sets the Rice fading profile for fading path 2 of group 1.
FSIM:DEL:GRO:PATH2:PRAT -15
sets a power ratio of -15 dB. The distributed (Rayleigh) component prevails. The total power of the two components remains constant.
```

**Manual operation:** See "[Power Ratio](#)" on page 51

```
[:SOURce<hw>]:FSIMulator:MDELay:DEL30:GROup<st>:PATH<ch>:PROFile <Profile>
[:SOURce<hw>]:FSIMulator:DELay|DEL:GROup<st>:PATH<ch>:PROFile <Profile>
Selects the fading profile for the paths.
```

**Parameters:**

<Profile> SPATH | RAYLeigh | PDOPpler | RICE | CPHase | OGAUs | TGAUs | DGAUs | WDOPpler | WRICe | GDOPpler | GFD8 | GFD1 | WATTerson | CUSTom | SCM | BELLindoor | BELVehicle

**SPAT**

static transmission path

**PDOPpler | RAYLeigh | RICE | CUSTom | SCM**  
 pure Doppler | Rayleigh | Rice | Custom | SCM

**CPHase**

constant phase

**OGAUs | TGAUs | DGAUs | GDOPpler | GFD8 | GFD1**  
 GAUS1 | GAUS2 | GAUSDAB | Gauss Doppler | Gauss (0.08 f<sub>d</sub>) | Gauss (0.01 f<sub>d</sub>)

**WATTerson**

Gauss (Watterson)

**WDOPpler | WRICe**

WiMAX Doppler | WiMAX Rice

**BELLindoor|BELVehicle**

Bell Shape tgn Indoor, Bell Shape tgn Moving Vehicle

\*RST: RAYLeigh

**Options:**

OGAUs|TGAUs|DGAUs|GDOPpler|GFD8|GFD1|WATTerson|WDOPpler|WRICe require R&S SMW-K72  
 SCM require R&S SMW-K73  
 CUSTom require R&S SMW-K820

**Manual operation:** See "[Profile](#)" on page 49

**[:SOURce<hw>]:FSIMulator:MDELay:DEL30:GROup<st>:PATH<ch>:SPEed <Speed>**  
**[:SOURce<hw>]:FSIMulator:DElay|DEL:GROup<st>:PATH<ch>:SPEed <Speed>**

Sets the speed v of the moving receiver.

**Parameters:**

<Speed> float  
 Range: 0 to dynamic  
 Increment: 0.001  
 \*RST: 0.83333

**Example:** FSIM:DEL:STAT ON  
 Activates the "Standard Delay" fading configuration.  
 FSIM:DEL:GRO:PATH2:SPE 2MPS  
 sets a speed of 2 m/s for the moving receiver for fading path 2 of group 1.

**Manual operation:** See "[Speed](#)" on page 52

**[:SOURce<hw>]:FSIMulator:MDELay:DEL30:GROup<st>:PATH<ch>:STATe <State>**  
**[:SOURce<hw>]:FSIMulator:DElay|DEL:GROup<st>:PATH<ch>:STATe <State>**

Activates the selected path.

**Parameters:**

<State> 1 | ON | 0 | OFF  
 \*RST: 0

**Example:** FSIM:DEL:STAT ON  
 Activates the "Standard Delay" fading configuration.  
 FSIM:DEL:GRO:PATH2:STAT ON  
 Activates fading path 2 in group 1.

**Manual operation:** See "[State Path](#)" on page 48

**[:SOURce<hw>]:FSIMulator:DElay|DEL:STATe <State>**

Activates the fading configurations.

**Note:** Changing the configuration will cause an interruption in the fading process, followed by a restart after about one second.

**Parameters:**

<State> 1 | ON | 0 | OFF  
 \*RST: 0

**Example:** FSIM:DEL:STAT ON  
 Activates the "Standard Delay" fading configuration for fader A and switches on fading for path A.

## 6.3 Birth death

Option: R&S SMW-K71

[:SOURce<hw>]:FSIMulator:BIRTHdeath:DELay:GRID.....	183
[:SOURce<hw>]:FSIMulator:BIRTHdeath:DELay:MINimum.....	183
[:SOURce<hw>]:FSIMulator:BIRTHdeath:DELay:MAXimum?.....	183
[:SOURce<hw>]:FSIMulator:BIRTHdeath:HOPPing:DWEli.....	184
[:SOURce<hw>]:FSIMulator:BIRTHdeath:PATH<ch>:LOSS.....	184
[:SOURce<hw>]:FSIMulator:BIRTHdeath:PATH<ch>:PROFile.....	184
[:SOURce<hw>]:FSIMulator:BIRTHdeath:POSitions.....	185
[:SOURce<hw>]:FSIMulator:BIRTHdeath:SOFFset.....	185
[:SOURce<hw>]:FSIMulator:BIRTHdeath:SPEed.....	185
[:SOURce<hw>]:FSIMulator:BIRTHdeath:FRATio.....	186
[:SOURce<hw>]:FSIMulator:BIRTHdeath:PATH<ch>:FDOPpler?.....	186
[:SOURce<hw>]:FSIMulator:BIRTHdeath:PATH<ch>:FDOPpler:ACTual?.....	187
[:SOURce<hw>]:FSIMulator:BIRTHdeath:STATe.....	187

### [:SOURce<hw>]:FSIMulator:BIRTHdeath:DELay:GRID <Grid>

Sets the delay grid for both paths with birth death propagation fading.

**Parameters:**

<Grid>	float
	Range: 1E-9 to dynamic
	Increment: 1E-9
	*RST: 1E-6

**Example:** FSIM:BIRT:DEL:GRID 0.00001

Sets a delay grid of 10 us.

**Manual operation:** See "[Delay Grid](#)" on page 60

### [:SOURce<hw>]:FSIMulator:BIRTHdeath:DELay:MINimum <Minimum>

### [:SOURce<hw>]:FSIMulator:BIRTHdeath:DELay:MAXimum?

Queries the minimum/maximum delay for both paths with birth death propagation fading.

**Return values:**

<Maximum>	float
	Range: 0 to max

**Example:**

```
FSIM:BIRT:DEL:MIN 0.000012
Sets a minimum delay of 12 us.
FSIM:BIRT:DEL:GRID 0.000002
sets a delay grid of 2 us.
FSIM:BIRT:POS 9
sets 9 possible hop positions.
FSIM:BIRT:DEL:MAX?
queries the maximum delay.
Response: 0.000028
the maximum delay is 28 us. The delay range lies between +12
and +28 us. There are 9 hop positions on a 2 us grid available.
```

**Usage:** Query only

**Manual operation:** See "[Maximum Delay](#)" on page 61

#### **[:SOURce<hw>]:FSIMulator:BIRTHdeath:HOPPing:DWEI <Dwell>**

Sets the time until the next change in the delay of a path (birth death event).

**Parameters:**

<Dwell>	float
	Range: 1E-3 to 429.49672950
	Increment: 100E-9
	*RST: 191E-3

**Example:**

```
FSIM:BIRT:HOPP:DWEI 210 ms
```

Sets a dwell time of 210 ms until the next change in the delay of a fading path.

**Manual operation:** See "[Hopping Dwell](#)" on page 61

#### **[:SOURce<hw>]:FSIMulator:BIRTHdeath:PATH<ch>:LOSS <Loss>**

Sets the loss of the paths with birth death propagation.

**Parameters:**

<Loss>	float
	Range: 0 to 50
	Increment: 0.001
	*RST: 0
	Default unit: dB

**Example:**

```
FSIM:BIRT:PATH2:LOSS 4 dB
```

Sets a loss of 4 dB for the second fading path.

**Manual operation:** See "[Path Loss](#)" on page 60

#### **[:SOURce<hw>]:FSIMulator:BIRTHdeath:PATH<ch>:PROFile <Profile>**

This command queries the fading profile. In birth death propagation, the pure Doppler profile is used.

**Parameters:**

<Profile> PDOPpler  
\*RST: PDOPpler

**Example:**

FSIM:BIRT:PATH2:PROF?

Queries the profile of the second fading path.

**Manual operation:** See "[Profile](#)" on page 60

---

**[:SOURce<hw>]:FSIMulator:BIRTHdeath:POSitions <Positions>**

Sets the number of possible hop positions in the delay range.

0 us < ( . . . :BIRT:POS – 1) x . . . :DEL:GRID + . . . :DEL:MIN < 40 us

**Parameters:**

<Positions> integer  
Range: 3 to 50  
\*RST: 11

**Example:**

FSIM:BIRT:POS 11

Sets 11 possible delay positions.

**Manual operation:** See "[Positions](#)" on page 60

---

**[:SOURce<hw>]:FSIMulator:BIRTHdeath:SOFFset <Soffset>**

Sets the time until the start of the next birth death event. With dual-channel fading, this allows the user to intentionally displace the birth death events of the two faders with respect to one another.

**Parameters:**

<Soffset> float  
Range: 0 to 429  
Increment: 100E-9  
\*RST: 0

**Example:**

FSIM:BIRT:SOFF 21E-6

Sets a start offset of 21 us.

**Manual operation:** See "[Start Offset](#)" on page 61

---

**[:SOURce<hw>]:FSIMulator:BIRTHdeath:SPEed <Speed>**

Sets the speed of the moving receiver for birth death propagation.

The default speed unit is m/s. Units different than the default one must be specified.

**Parameters:**

<Speed> float  
Range: 0 to dynamic  
Increment: 0.001  
\*RST: 0  
Default unit: m/s

**Example:**

```
SOURce1:FSIMulator:BIRTHdeath:SPEEd 100 KMH
SOURce1:FSIMulator:BIRTHdeath:PATH1:FDOPlEr?
// 92.6574343641427
SOURce1:FSIMulator:BIRTHdeath:FRATio 1
SOURce1:FSIMulator:BIRTHdeath:PATH1:FDOPlEr:ACTual?
// 92.66
SOURce1:FSIMulator:BIRTHdeath:FRATio 0.5
SOURce1:FSIMulator:BIRTHdeath:PATH1:FDOPlEr:ACTual?
// 46.33
```

**Manual operation:** See "[Speed](#)" on page 62

---

**[:SOURce<hw>]:FSIMulator:BIRTHdeath:FRATio <FRatio>**

Sets the ratio of the actual Doppler frequency to the set Doppler frequency with birth death propagation fading.

**Parameters:**

<FRatio> float  
Range: -1 to 1  
Increment: 0.0001  
\*RST: 1

**Example:** See [\[:SOURce<hw>\]:FSIMulator:BIRTHdeath:SPEEd](#) on page 185

**Manual operation:** See "[Frequency Ratio](#)" on page 62

---

**[:SOURce<hw>]:FSIMulator:BIRTHdeath:PATH<ch>:FDOPpler?**

Queries the resulting Doppler frequency with birth death propagation.

**Return values:**

<FDoppler> float  
Range: 0 to 1000  
Increment: 0.01  
\*RST: 0

**Example:** See [\[:SOURce<hw>\]:FSIMulator:BIRTHdeath:SPEEd](#) on page 185

**Usage:** Query only

**Manual operation:** See "[Resulting Doppler Shift](#)" on page 62

**[[:SOURce<hw>](#)]:FSIMulator:BIRTHdeath:PATH<ch>:FDOPpler:ACTual?**

Queries the actual Doppler frequency.

**Return values:**

<a href="#">&lt;ActDoppler&gt;</a>	float
	Range: -1600 to 1600
	Increment: 0.01
	*RST: 0

**Example:** See [[:SOURce<hw>](#)]:FSIMulator:BIRTHdeath:SPEed on page 185

**Usage:** Query only

**Manual operation:** See "Actual Doppler Shift" on page 63

**[[:SOURce<hw>](#)]:FSIMulator:BIRTHdeath:STATe <State>**

This command selects the birth death propagation fading configuration and switches the fading simulation on and off.

**Parameters:**

<a href="#">&lt;State&gt;</a>	1   ON   0   OFF
	*RST: 0

**Example:** SOUR2:FSIM:BIRT:STAT ON  
Selects birth death propagation for fader B and switches on fading in path B.

**Manual operation:** See "Configuration" on page 31

## 6.4 High-speed train

Option: R&S SMW-K71.

**Example: Enabling and configuring a high-speed train propagation**

The following is an example of how to configure the settings without using a predefined standard.

```
SOURCE1:FSIMulator:CONFiguration HSTRain
SOURCE1:FSIMulator:HSTRain:PROFile PDOPpler
SOURCE1:FSIMulator:HSTRain:SPEED 100kmh
SOURCE1:FSIMulator:HSTRain:FDOPpler?
// Response in Hz: "92.657"
SOURCE1:FSIMulator:HSTRain:DISTance:MINimum 20m
SOURCE1:FSIMulator:HSTRain:DISTance:STARt 2000m
SOURCE1:FSIMulator:HSTRain:PATH:STATE ON
SOURCE1:FSIMulator:HSTRain:STATE ON
```

**Example: Querying doppler shifts for high-speed train profiles**

The following is an example of how to configure the settings without using a predefined standard.

```
SOURcel:FSIMulator:CONFiguration HSTRain
// Set static path profile.
SOURcel:FSIMulator:HSTRain:PROFile SPATH
SOURcel:FSIMulator:HSTRain:SPEEd 4300kmh
SOURcel:FSIMulator:HSTRain:SPEED?
// Response in m/s: "1199.17"
SOURcel:FSIMulator:HSTRain:FDOppler?
// Response in Hz: "4000"

// Set pure Doppler profile.
SOURcel:FSIMulator:HSTRain:PROFile PDOPpler
SOURcel:FSIMulator:HSTRain:SPEEd 205058kmh
SOURcel:FSIMulator:HSTRain:SPEED?
// Response in m/s: "56960.567"
SOURcel:FSIMulator:HSTRain:FDOppler?
// Response in Hz: "190000"
Pure Doppler profile offers Doppler shifts of up to 190 kHz.
```

**Example: Configuring a high-speed train scenario for BS tests**

The following is an example of how to configure fading simulator to generate an HST BS test signal according to 3GPP TS36.104.

For frequency Band 1 tests, the specification defines:

$F_{DL} = 2.14 \text{ GHz}$ ,  $F_{UL} = 1.95 \text{ GHz}$  and  $F_D = 1140 \text{ Hz}$

```
SOURcel:FSIMulator:PRESet
SOURcel:FSIMulator:STANdard G3HST1OSDU
SOURcel:FREQuency:CW 1.95E9
SOURcel:FSIMulator:HSTRain:DOWNlink:FREQuency:STATe ON
SOURcel:FSIMulator:HSTRain:DOWNlink:FREQuency 2.14E9
SOURcel:FSIMulator:HSTRain:SOFFSet 0
SOURcel:FSIMulator:HSTRain:PATH:STATe ON
SOURcel:FSIMulator:HSTRain:STATE ON
SOURcel:FSIMulator:HSTRain:FDOppler?
// Response in Hz: 1136.893
```

**Commands**

[:SOURce<hw>]:FSIMulator:HSTRain:STATe.....	192

---

**[:SOURce<hw>]:FSIMulator:HSTRain:DISTance:MINimum <Minimum>**

Sets the parameter  $D_{\min}$ , i.e. the distance between the BS and the railway track.

**Parameters:**

<Minimum>	float
	Range: 1 to 100
	Increment: 0.1
	*RST: 2

**Example:** See [Example "Enabling and configuring a high-speed train propagation" on page 187](#)

**Manual operation:** See "[D \(min\)](#)" on page 86

---

**[:SOURce<hw>]:FSIMulator:HSTRain:DISTance:STARt <Start>**

Sets the parameter  $D_S$ , i.e. the initial distance  $D_S/2$  between the train and the BS at the beginning of the simulation.

**Parameters:**

<Start>	integer
	Range: 20 to 2000
	*RST: 300

**Example:** See [Example "Enabling and configuring a high-speed train propagation" on page 187](#)

**Manual operation:** See "[D \(S\)](#)" on page 86

---

**[:SOURce<hw>]:FSIMulator:HSTRain:SPEEd <Speed>**

Sets the velocity parameter , i.e. the speed of the moving receiver in m/s.

**Parameters:**

<Speed>	float
	Range: 0.001 to depends on settings
	Increment: 0.001
	*RST: 83.333

**Example:** See [Example "Enabling and configuring a high-speed train propagation" on page 187.](#)

**Example:** See [Example "Querying doppler shifts for high-speed train profiles" on page 188.](#)

**Manual operation:** See "[Speed](#)" on page 86

---

[:SOURce<hw>]:FSIMulator:HSTRain:FDOPler?

Queries the maximum Doppler Shift for the selected configuration.

**Return values:**

<FDoppler>	float
	Range: 0 to depends on settings
	Increment: 0.01
	*RST: 0

**Example:** See [Example "Querying doppler shifts for high-speed train profiles" on page 188](#).

**Usage:** Query only

---

## [:SOURce&lt;hw&gt;]:FSIMulator:HSTRain:PATH:STATe &lt;State&gt;

Activates/deactivates the selected path for the High Speed Train fading configurations.

**Parameters:**

<State>	1   ON   0   OFF
	*RST: 1

**Example:** See [Example "Enabling and configuring a high-speed train propagation" on page 187](#)

**Manual operation:** See ["State Path"](#) on page 48

---

## [:SOURce&lt;hw&gt;]:FSIMulator:HSTRain:PROFile &lt;Profile&gt;

Determines the fading profile for the selected scenario. The fading profile determines which transmission path is simulated.

**Parameters:**

<Profile>	SPATH   PDOPpler   RAYLeigh
	*RST: PDOPpler

**Example:** See [Example "Enabling and configuring a high-speed train propagation" on page 187](#)

**Manual operation:** See ["Profile"](#) on page 85

---

## [:SOURce&lt;hw&gt;]:FSIMulator:HSTRain:KFACTOR &lt;KFactor&gt;

Sets the Rician factor K for high speed train scenario 2.

**Parameters:**

<KFactor>	float
	Range: -30 to 30
	Increment: 0.01
	*RST: 10

**Example:** SOURce1:FSIMulator:PRESet  
 SOURce1:FSIMulator:STANdard G3HST2TLC  
 SOURce1:FSIMulator:HSTRain:KFACTor 10

**Manual operation:** See "[K \(Rician factor\)](#)" on page 86

**[:SOURce<hw>]:FSIMulator:HSTRain:DOWNlink:FREQuency:STATe <HstDIFreqState>**

Enables the definition of virtual downlink frequency.

**Parameters:**

<HstDIFreqState> 1 | ON | 0 | OFF  
 \*RST: 0

**Example:** See [Example"Configuring a high-speed train scenario for BS tests"](#) on page 188

**Manual operation:** See "[Consider DL RF](#)" on page 86

**[:SOURce<hw>]:FSIMulator:HSTRain:DOWNlink:FREQuency <HstDIFreq>**

Sets the virtual downlink frequency, necessary to calculate the UL Doppler shift.

**Parameters:**

<HstDIFreq> float  
 Range: 100E3 to 6E9  
 Increment: 0.01  
 \*RST: 1E9

**Example:** See [Example"Configuring a high-speed train scenario for BS tests"](#) on page 188

**Manual operation:** See "[Virtual DL RF](#)" on page 87

**[:SOURce<hw>]:FSIMulator:HSTRain:SOFFset <StartOffset>**

Shifts the high speed train profile in time.

The maximum possible shift is calculated as  $\text{max} = 2*D_S/v$ , where:

- $D_S$  is the distance in meters between the train and the BS at the beginning of the simulation
- $v$  is the velocity of the train in m/s

**Parameters:**

<StartOffset> float  
 Range: 0 to 429.49672950  
 Increment: 100E-9  
 \*RST: 0

**Example:** See [Example"Configuring a high-speed train scenario for BS tests"](#) on page 188.

**Manual operation:** See "Start Offset" on page 87

#### **[:SOURce<hw>]:FSIMulator:HSTRain:STATe <State>**

Activates/deactivates simulation of High Speed Train propagation according to the selected scenario 1 or 3.

**Parameters:**

<State>	1   ON   0   OFF
	*RST: 0

**Example:** See Example "Enabling and configuring a high-speed train propagation" on page 187

**Manual operation:** See "Configuration" on page 31  
See "State" on page 85

## 6.5 Moving propagation

Option: R&S SMW-K71.

[:SOURce<hw>]:FSIMulator:MDELay:ALL:MOVing:VPERiod.....	192
[:SOURce<hw>]:FSIMulator:MDELay:ALL:MOVing:DElay:VARiation.....	193
[:SOURce<hw>]:FSIMulator:MDELay:CHANnel:MODE.....	193

[:SOURce<hw>]:FSIMulator:MDELay:MOVing:VPERiod.....	195
[:SOURce<hw>]:FSIMulator:MDELay:REFERENCE:DElay.....	196
[:SOURce<hw>]:FSIMulator:MDELay:REFERENCE:LOSS.....	196
[:SOURce<hw>]:FSIMulator:MDELay:REFERENCE:STATe.....	196
[:SOURce<hw>]:FSIMulator:MDELay:STATe.....	197

#### **[:SOURce<hw>]:FSIMulator:MDELay:ALL:MOVing:VPERiod <VPeriod>**

Sets the speed of the delay variation of the moving fading paths for moving propagation with all moving channels. A complete cycle comprises one pass through this "Variation Period".

**Parameters:**

<VPeriod>	float
	Range: 5 to 200
	Increment: 0.1
	*RST: 25

**Example:**

```
FSIM:CONF MDEL  
Selects a moving propagation configuration.  
FSIM:MDEL:CHAN:MODE ALL  
enables all moving channels.  
FSIM:MDEL:STAT ON  
activates the moving propagation for fader A.  
FSIM:MDEL:ALL:MOV:VPER 50 s  
sets the period for the delay variation to 100 s.
```

**Manual operation:** See "[Variation Period](#)" on page 71

---

**[*:SOURce<hw>*]:FSIMulator:MDELay:ALL:MOVing:DElay:VARiation <Variation>**

This command enters the range for the delay of the moving fading paths for moving propagation with all moving channels. The delay of the moving path slowly varies sinusoidally within this range.

**Parameters:**

<Variation>	float
	Range: 0.3E-6 to 10E-6
	Increment: 10E-9
	*RST: 5E-6

**Example:**

```
FSIM:CONF MDEL  
Selects a moving propagation configuration.  
FSIM:MDEL:CHAN:MODE ALL  
enables all moving channels.  
FSIM:MDEL:STAT ON  
activates the moving propagation for fader A.  
FSIM:MDEL:ALL:MOV:DEL:VAR 1E-5  
sets the range 10 us for the delay of the moving fading path.
```

**Manual operation:** See "[Delay Variation \(Peak-Peak\)](#)" on page 71

---

**[*:SOURce<hw>*]:FSIMulator:MDELay:CHANnel:MODE <Mode>**

Determines whether only one or several moving channels are simulated.

**Parameters:**

<Mode>	ONE   ALL
	*RST: ONE

**Example:**

```
FSIM:CONF MDEL  
Selects a moving propagation configuration.  
FSIM:MDEL:CHAN:MODE ALL  
enables all moving channels.
```

**Manual operation:** See "[Moving Channels](#)" on page 34

---

**[:SOURce<hw>]:FSIMulator:MDELay:DEL30:GROup<st>:PATH<ch>:CPHase <CPhase>**

These commands determine the phase for constant phase fading for the "Standard Delay", and "Moving Propagation All Moving Channels" fading configurations.

**Parameters:**

<CPhase> float

Range: 0 to 359.9

Increment: 0.1

\*RST: 0

**Example:**

FSIM:DEL:STAT ON

Activates the Standard Delay fading configuration.

FSIM:DEL:GRO2:PATH:PROF CPH

selects the Constant Phase fading profile for fading path 1 of group 2.

FSIM:DEL:GRO2:PATH:CPH 5DEG

sets a phase of 5 DEG for fading path 1 of group 2. The path is multiplied by this phase.

---

**[:SOURce<hw>]:FSIMulator:MDELay:MOVing:DELay:MEAN <Mean>**

Sets the mean delay of the moving fading path for moving propagation.

**Parameters:**

<Mean> float

Range: 0 to 40E-6

Increment: 10E-9

\*RST: 3.5E-6

**Example:**

FSIM:MDEL:STAT ON

Sets moving propagation.

FSIM:MDEL:MOV:DEL:VAR 1E-5

sets the range 10 us (+/- 5 us) for the variation of the delay of the moving fading path.

FSIM:MDEL:MOV:DEL:MEAN 9E-6

sets the mean delay of the moving path to 9 us.

FSIM:MDEL:MOV:VPER 105

sets a period of 105 s for the sinusoidal variation of the delay of the moving path. The delay of the moving path now varies once sinusoidal in 105 s between 4 us and 14 us.

**Manual operation:** See "[Delay](#)" on page 69

---

**[:SOURce<hw>]:FSIMulator:MDELay:MOVing:DELay:VARiation <Variation>**

Enters the range for the delay of the moving fading path for moving propagation. The delay of the moving path slowly varies sinusoidal within this range.

**Parameters:**

<Variation> float  
 Range: 0.3E-6 to dynamic  
 Increment: 10E-9  
 \*RST: 5E-6

**Example:** FSIM:MDEL:MOV:DEL:VAR 1E-5

Sets the range 10 us for the delay of the moving fading path.

**Manual operation:** See "[Variation \(Peak-Peak\)](#)" on page 69

**[:SOURce<hw>]:FSIMulator:MDELay:MOVing:LOSS <Loss>**

Sets the insertion loss of the moving path for moving propagation.

**Parameters:**

<Loss> float  
 Range: 0 to 50  
 Increment: 0.001  
 \*RST: 0

**Example:** FSIM:MDEL:MOV:LOSS 12 dB

Sets the loss for the moving fading path.

**Manual operation:** See "[Path Loss](#)" on page 69

**[:SOURce<hw>]:FSIMulator:MDELay:MOVing:STATe <State>**

This command activates the moving fading path for moving propagation.

**Parameters:**

<State> 1 | ON | 0 | OFF  
 \*RST: 1

**Example:** FSIM:MDEL:STAT ON

Sets moving propagation.

FSIM:MDEL:MOV:STAT ON

activates the moving path for moving propagation.

**Manual operation:** See "[State](#)" on page 69

**[:SOURce<hw>]:FSIMulator:MDELay:MOVing:VPERiod <VPeriod>**

This command sets the speed of the delay variation of the moving fading path for moving propagation. A complete cycle comprises one pass through this "Variation Period".

**Parameters:**

<VPeriod> float  
 Range: 10 to 500  
 Increment: 0.1  
 \*RST: 157

**Example:** FSIM:MDEL:MOV:VPER 100 s  
Sets the period for the delay variation to 100 s.

**Manual operation:** See "[Variation Period](#)" on page 70

---

**[:SOURce<hw>]:FSIMulator:MDELay:REFerence:DELay <Delay>**

This command enters the delay of the reference path for moving propagation.

**Parameters:**

<Delay>	float
	Range: 0 to 40E-6
	Increment: 10E-9
	*RST: 0

**Example:** FSIM:MDEL:REF:DEL 1E-5  
Sets the range to 10 us for the delay of the reference path.

**Manual operation:** See "[Delay](#)" on page 69

---

**[:SOURce<hw>]:FSIMulator:MDELay:REFerence:LOSS <Loss>**

Sets the loss of the reference path for moving propagation.

**Parameters:**

<Loss>	float
	Range: 0 to 50
	Increment: 0.001
	*RST: 0

**Example:** FSIM:MDEL:REF:LOSS 12 dB  
Sets the insertion loss for the reference path.

**Manual operation:** See "[Path Loss](#)" on page 69

---

**[:SOURce<hw>]:FSIMulator:MDELay:REFerence:STATe <State>**

This command activates the reference path for moving propagation.

**Parameters:**

<State>	1   ON   0   OFF
	*RST: 1

**Example:** FSIM:MDEL:STAT ON  
Sets moving propagation.  
FSIM:MDEL:REF:STAT ON  
activates the reference path for moving propagation.

**Manual operation:** See "[State](#)" on page 69

**[**:SOURce<hw>]:FSIMulator:MDELay:STATE <State>****

This command activates the moving propagation fading configuration. The paths and the fading simulator must be switched on separately  
(**SOURce:FSIMulator:MDELay:MOVing | REReference:STATE ON** and  
**SOURce:FSIMulator ON**).

**Parameters:**

<State>            1 | ON | 0 | OFF  
                    \*RST:        0

**Example:**            FSIM:MDEL:STAT ON  
                         Sets moving propagation for fader A.

**Manual operation:** See "[Configuration](#)" on page 31

## 6.6 MIMO settings

The MIMO configurations require additional options:

- For up to 2x2 MIMO configurations, 2x option R&S SMW-B14/B15 and R&S SMW-K74
- The LxMxN MIMO configurations with M > 2 or N > 2 require 4xR&S SMW-B14/B15 and R&S SMW-K74
- Higher-order MIMO configurations require R&S SMW-K75
- Multi entity LxMxN configurations with L > 2 require also R&S SMW-K76

The options above apply to all commands in this section. If further options are required, there are listed in the corresponding command.

**Example: Enabling an 1x8x8 MIMO configuration with two R&S SMW**

In the following, we assume that the two R&S SMW are connected and configured as required.

The example uses R&S SGS as RF extensions and the internal baseband signal of the first R&S SMW as trigger source for both instruments. If you use common external trigger source, consider to adapt the proposed configuration.

```
*RST
// Select 8x8 MIMO and set MIMO subset.
SCONfiguration:MODE ADV
SCONfiguration:FADING MIMO8X8
SCONfiguration:MIMO:SUBSet SET1

SCONfiguration:APPLY
// The instrument generates streams A to D.
// Configure connectors for synchronous baseband triggering.
// Alternatively, use an external common trigger source.
SOURCE1:INPut:USER6:DIRECTION OUTP
OUTPUT1:USER6:SIGNAl MTR
```

```

// Configure the fading simulator.
// Enable synchronization of the fading process to the baseband trigger.
SOURcel:FSIMulator:REStart:MODE BBTR
SOURcel:FSIMulator:STATe 1

// Configure the baseband signal incl. trigger settings.
// Synchronize baseband triggering for an external common trigger source.
// Adapt configuration.
SOURcel:BB:EUTRa:TRIGger:SEQuence ARET
SOURcel:BB:EUTRa:TRIGger:SOURce EGT1
SOURcel:BB:EUTRa:STATe 1

// Set frequency and level of the RF signal.
SOURcel:FREQuency:CW 1950000000
SOURce2:FREQuency:CW 1950000000
SOURcel:POWer:POWer -50
SOURce2:POWer:POWer -50
// Connect and configure the RF extensions, for example, R&S SGS.
SOURCE1:IQ:OUTPut:ANALog:STATe 1
SOURCE2:IQ:OUTPut:ANALog:STATe 1

// Activate the IQ and RF outputs.
SOURCE2:IQ:STATe 1
SOURcel:IQ:STATe 1
OUTPut2:STATe 1
OUTPut1:STATe 1

// Save the configuration.
*SAV 1
MMEMory:STORe:STATe 1,"/var/user/8x8_MIMO_Subset1.savrcl.txt"

// Transfer to file to the second instrument
// Load the configuration and change the subset.
SCONfiguration:MIMO:SUBSet SET2

// Trigger the baseband signal generation and hence the fading process.
OUTPut1:USER6:TRIGger:IMMediate

```

**[:SOURce<hw>]:FSIMulator:MIMO:CAPability?**

Queries the supported MIMO configurations.

**Return values:**

<MimoCapability>     string

**Example:**

```
:SOURce1:FSIMulator:MIMO:CAPability?  
Response: "M2X2,M2X4,M4X2,M2X3,M3X2,M1X2,..."
```

**Usage:**

Query only

**[:SOURce<hw>]:FSIMulator:MIMO:COPY:NEXT**

Copies the matrix values of the current tap to the subsequent tap. If the current tap is the last tap, the command is discarded.

See also [\[:SOURce<hw>\]:FSIMulator:MIMO:COPY:ALL](#) on page 199.

**Usage:**                  Event

**Manual operation:** See "Copy To Next" on page 103

**[:SOURce<hw>]:FSIMulator:MIMO:COPY:ALL**

Applies the matrix values of the current tap to all taps.

**Usage:**                  Event

**Manual operation:** See "Copy To All" on page 103

---

**[:SOURce<hw>]:FSIMulator:MIMO:COPY:PREVIOUS**

This command copies the matrix values of the current tap to the next lower tap.

- Example:** FSIM:MIMO:COPY:PREV  
Copies the settings of the current tap to the next lower tap.
- Usage:** Event
- Manual operation:** See "[Copy To Prev](#)" on page 103
- 

**[:SOURce<hw>]:FSIMulator:MIMO:MDLoad <MDLoad>**

Loads file with saved MIMO settings.

- Setting parameters:**
- <MDLoad> string
- Example:** FSIM:MIMO:MDL 'MIMO\_Settings'  
Loads the settings file.
- Usage:** Setting only
- 

**[:SOURce<hw>]:FSIMulator:MIMO:MDSTore <MDStore>**

Saves the MIMO settings in a file.

- Setting parameters:**
- <MDStore> string
- Example:** FSIM:MIMO:MDST 'MIMO\_Settings'  
Saves the MIMO settings in a file.
- Usage:** Setting only
- 

**[:SOURce<hw>]:FSIMulator:MIMO:TAP <Tap>**

Sets the current tap.

- Parameters:**
- <Tap> TAP1 | TAP2 | TAP3 | TAP4 | TAP5 | TAP6 | TAP7 | TAP8 |  
TAP9 | TAP10 | TAP11 | TAP12 | TAP13 | TAP14 | TAP15 |  
TAP16 | TAP17 | TAP18 | TAP19 | TAP20
- \*RST: TAP1
- Example:** SORce1:FSIMulator:MIMO:TAP TAP15
- Manual operation:** See "[Current Path \(Tap\) #](#)" on page 103
- 

**[:SOURce<hw>]:FSIMulator:MIMO:SUBSet <Subset>**

In 8x8 or 4x4 MIMO configuration with higher fading bandwidth, sets the subset of MIMO channels that is calculated by the particular R&S SMW.

**Parameters:**

<Subset>           SET2 | SET1 | ALL  
                   \*RST:       SET1 (R&S SMW-B10)/ALL(R&S SMW-B9)

**Example:**       See [Example "Enabling an 1x8x8 MIMO configuration with two R&S SMW"](#) on page 197.

**Options:**       ALL requires R&S SMW-B9  
                  SET2|SET1 requires R&S SMW-K821/K822.

**[:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:KRONecker:CORRelation:RX:  
     ROW<di>:COLumn<st>:IMAGinary <Imaginary>  
  [:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:KRONecker:CORRelation:TX:  
     ROW<di>:COLumn<st>:IMAGinary <Imaginary>**

Sets the value for the imaginary part of the receiver/transmitter correlation.

**Note:** If the values for the real part and the imaginary part are both set to 0, the phase value is set to 0 when changing the data format.

**Parameters:**

<Imaginary>       float  
                   Range:     -1 to 1  
                   Increment: 0.001  
                   \*RST:     0

**Example:**       SOURce1:FSIMulator:MIMO:TAP2:KRONecker:  
                   CORRelation:TX:ROW1:COLumn2:IMAGinary 0.5  
                   Sets the imaginary part of the Tx correlation AB to 0.5.

**Manual operation:** See ["Tx Correlation Coefficients, Phase/Imag"](#) on page 109

**[:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:KRONecker:CORRelation:RX:  
     ROW<di>:COLumn<st>:PHASe <Phase>  
  [:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:KRONecker:CORRelation:TX:  
     ROW<di>:COLumn<st>:PHASe <Phase>**

Sets the value for the phase of the receiver/transmitter correlation.

**Note:** If the values for the real part and the imaginary part are both set to 0, the phase value is set to 0 when changing the data format.

**Parameters:**

<Phase>           float  
                   Range:     0 to 360  
                   Increment: 0.02  
                   \*RST:     0

**Example:**       SOURce1:FSIMulator:MIMO:TAP2:KRONecker:  
                   CORRelation:TX:ROW1:COLumn2:PHASe 30  
                   Sets the phase of the Tx correlation AB to 30 degrees.

**Manual operation:** See ["Tx Correlation Coefficients, Phase/Imag"](#) on page 109

---

```
[:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:KRONecker:CORRelation:RX:
    ROW<di>:COLumn<st>:MAGNitude <Magnitude>
[:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:KRONecker:CORRelation:TX:
    ROW<di>:COLumn<st>:MAGNitude <Magnitude>
```

Sets the ratio of the receiver/transmitter correlation.

**Note:** If the values for the real part and the imaginary part are both set to 0, the phase value is set to 0 when changing the data format.

**Parameters:**

<Magnitude>	float
	Range: 0 to 1
	Increment: 1E-4
	*RST: 0

**Example:**

```
SOURce1:FSIMulator:MIMO:TAP2:KRONecker:
CORRelation:TX:ROW1:COLumn2:MAGNitude 0.5
```

Sets the ratio of the Tx correlation AB to 0.5.

**Manual operation:** See "[Tx Correlation Coefficients, Magnitude/Real](#)" on page 109

---

```
[:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:KRONecker:CORRelation:RX:
    ROW<di>:COLumn<st>:REAL <Real>
[:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:KRONecker:CORRelation:TX:
    ROW<di>:COLumn<st>:REAL <Real>
```

Sets the value for the real part of the receiver/transmitter correlation.

**Note:** If the values for the real part and the imaginary part are both set to 0, the phase value is set to 0 when changing the data format.

**Parameters:**

<Real>	float
	Range: -1 to 1
	Increment: 0.001
	*RST: 0

**Example:**

```
SOURce1:FSIMulator:MIMO:TAP2:KRONecker:
CORRelation:TX:ROW1:COLumn2:REAL 0.5
```

Sets the value for the real part of the Tx correlation AB to 0.5.

**Manual operation:** See "[Tx Correlation Coefficients, Magnitude/Real](#)" on page 109

---

```
[:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:MATRix:ACCept
```

Accepts the values for the phase/imaginary and the real/ration part of the correlation.

**Example:** FSIM:MIMO:TAP2:MATR:ACC

**Usage:** Event

**Options:** R&S SMW-K71/-K74

**Manual operation:** See "[Accept](#)" on page 106

---

[:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:MATRix:CONFLICT?

Queries whether there is a matrix conflict or not.

**Return values:**

<Conflict> 1 | ON | 0 | OFF

**Example:**

FSIM:MIMO:TAP2:MATR:CONF?

Queries whether there is a matrix conflict or not

**Usage:** Query only**Options:** R&S SMW-K71/-K74**Manual operation:** See "[Conflict](#)" on page 106

---

[:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:MATRix:MODE <Mode>

Sets the input mode for the Rx and Tx correlation values (matrix mode).

**Parameters:**

<Mode> INDividual | KRONecker | AOAaod | SCWI

\*RST: INDividual

**Example:**

FSIM:MIMO:TAP2:MATR:MODE IND

Selects the matrix mode individual.

**Options:** R&S SMW-K71/-K74**Manual operation:** See "[Matrix Mode](#)" on page 103

---

[:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:MATRix:ROW<di>:COLumn<st>:PHASe <Phase>

Sets the value for the phase/imaginary part of the correlation.

**Suffix:**

<di> 1 to 4

<st> 1 to 4

**Parameters:**

<Phase> float

Range: 0 to 360

Increment: 0.02

\*RST: 0

**Example:**

FSIM:MIMO:TAP2:MATR:ROW1:COL1:PHAS 90

Sets the correlation value to the specified value.

**Options:** R&S SMW-K71/-K74**Manual operation:** See "[Phase/Imag](#)" on page 106

---

**[*:SOURce<hw>*]:*FSIMulator:MIMO:TAP<ch>:MATRix:ROW<di>:COLumn<st>:MAGNitude* <Magnitude>**

Determines the value for the real/magnitude part of the correlation.

**Suffix:**

<di> 1 to 4

<st> 1 to 4

**Parameters:**

<Magnitude> float

Range: 0 to 1

Increment: 0.0001

\*RST: 1

**Example:**

FSIM:MIMO:TAP2:MATR:ROW1:COL1:MAGN 0.5

Sets the correlation value to the specified value.

**Options:**

R&S SMW-K71/-K74

**Manual operation:** See "[Real/Magnitude](#)" on page 106

---

**[*:SOURce<hw>*]:*FSIMulator:MIMO:TAP<ch>:GVECtor:PRESet***

The command presets the vector matrix to an unitary matrix.

**Example:**

FSIM:MIMO:TAP2:GVEC:PRES

Resets the gain vector matrix.

**Usage:**

Event

**Manual operation:** See "[Set to Unity](#)" on page 107

---

**[*:SOURce<hw>*]:*FSIMulator:MIMO:TAP<ch>:GVECtor<st>:GAIN* <Gain>**

Sets the relative gain in the selected path.

**Suffix:**

<st> 1 to 8

**Parameters:**

<Gain> float

Range: -50 to 0

Increment: 0.01

\*RST: 0

**Example:**

SOURce1:FSIMulator:MIMO:TAP2:GVECtor1:GAIN -3

Decreases the level in path AA by 3 dB.

**Manual operation:** See "[Gain](#)" on page 108

---

**[**:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:GVECtor<st>:PHASe <Phase>****

Sets the phase shift of the selected path.

**Suffix:**

<st>                  1 to 8

**Parameters:**

<Phase>              float

Range:            0 to 360

Increment:       0.02

\*RST:            0

**Example:**

SOURcel:FSIMulator:MIMO:TAP2:GVECtor1:PHASe 45

Shifts the phase in path AA by 45 degree.

**Options:**              R&S SMW-K820

**Manual operation:** See "[Phase](#)" on page 108

## 6.7 TGn settings

Option: R&S SMW-K74.

**Example: Simulating one path TGn fading with two rays with different distributions**

In the following example we assume that a MIMO fading configuration is enabled, e.g. 2x2 MIMO. One MIMO path is activated, the default path settings are used.

```
// ****
// Enable the corresponding matrix mode and set the relevant SCM settings
// ****

SOURCE:FSIMulator:MIMO:TAP:MATRix:MODE AOaod
SOURCE:FSIMulator:MIMO:TGN:ANTenna:DISTance:RX 0.5
SOURCE:FSIMulator:MIMO:TGN:ANTenna:DISTance:TX 0.5

// ****
// Set ray#1 to simulate signal scattered by
// obstacles causing static fading distribution, e.g. a building
// ****
SOURCE:FSIMulator:MIMO:TAP:TGN:RAY1:GAIN 0
SOURCE:FSIMulator:MIMO:TAP:TGN:RAY1:ARRival:ANGLE 72
SOURCE:FSIMulator:MIMO:TAP:TGN:RAY1:ARRival:SPRead 5
SOURCE:FSIMulator:MIMO:TAP:TGN:RAY1:DEParture:ANGLE 15
SOURCE:FSIMulator:MIMO:TAP:TGN:RAY1:DEParture:SPRead 3
SOURCE:FSIMulator:MIMO:TAP:TGN:DISTribution EQual
SOURCE:FSIMulator:MIMO:TAP:TGN:RAY1:STATE ON

// ****
```

```

// Set ray#2 to simulate signal scattered by
// obstacles causing Gaussian fading distribution, e.g. a tree
// ****
SOURCE:FSIMulator:MIMO:TAP:TGN:RAY2:GAIN -10
SOURCE:FSIMulator:MIMO:TAP:TGN:RAY2:ARRival:ANGLE 23
SOURCE:FSIMulator:MIMO:TAP:TGN:RAY2:ARRival:SPRead 7
SOURCE:FSIMulator:MIMO:TAP:TGN:RAY2:DEParture:ANGLE 25
SOURCE:FSIMulator:MIMO:TAP:TGN:RAY2:DEParture:SPRead 5
SOURCE:FSIMulator:MIMO:TAP:TGN:DISTribution GAUSS
SOURCE:FSIMulator:MIMO:TAP:TGN:RAY2:STATE ON

// ****
// Query the resulting matrix correlation coefficients with the
// SOURce:FSIMulator:MIMO:TAP:MATRix:... commands
// ****

```

## Commands

<a href="#">[:SOURce&lt;hw&gt;]:FSIMulator:MIMO:TGN:ANTenna:DISTance:RX</a>	206
<a href="#">[:SOURce&lt;hw&gt;]:FSIMulator:MIMO:TGN:ANTenna:DISTance:TX</a>	206

<a href="#">[:SOURce&lt;hw&gt;]:FSIMulator:MIMO:TAP&lt;ch&gt;:TGN:RAY&lt;st&gt;:GAIN</a>	207
<a href="#">[:SOURce&lt;hw&gt;]:FSIMulator:MIMO:TAP&lt;ch&gt;:TGN:RAY&lt;st&gt;:STATe</a>	208

**[:SOURce<hw>]:FSIMulator:MIMO:TGN:ANTenna:DISTance:RX <DistanceRx>**  
**[:SOURce<hw>]:FSIMulator:MIMO:TGN:ANTenna:DISTance:TX <DistanceTx>**

Sets the RX/TX antenna distance in the SCM fading model.

**Parameters:**

<DistanceTx>	float
	Range: 0.1 to 2
	Increment: 0.1
	*RST: 0.5

**Example:** See [Example "Simulating one path TGn fading with two rays with different distributions" on page 205](#).

**Manual operation:** See ["RX/TX Antenna Distance"](#) on page 111

**[:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:TGN:DISTribution <Distribution>**

Selects one of the proposed statistical functions to determine the distribution of the selected cluster.

**Parameters:**

<Distribution>	LAPLace   GAUSs   EQUal
	*RST: EQUal

**Example:** See [Example "Simulating one path TGn fading with two rays with different distributions" on page 205](#).

**Manual operation:** See ["Distribution"](#) on page 112

**[:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:TGN:RAY<st>:ARRival:ANGLE  
<ArrAngle>**

**[:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:TGN:RAY<st>:DEParture:ANGLE  
<DepAngle>**

Sets the AoA (Angle of Arrival) / AoD (Angle of Departure) of the selected ray.

**Parameters:**

**<DepAngle>** float

Range: 0 to 359.999

Increment: 0.001

\*RST: 0

**Example:** See [Example "Simulating one path TGn fading with two rays with different distributions" on page 205](#).

**Manual operation:** See ["Angle of Departure \(AoD\)"](#) on page 112

**[:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:TGN:RAY<st>:ARRival:SPRead  
<ArrSpread>**

**[:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:TGN:RAY<st>:DEParture:SPRead  
<DepSpread>**

Sets the AoD (Angle of Departure) / AoA (Angle of Arrival) spread (AS) of the selected ray.

**Parameters:**

**<DepSpread>** float

Range: 0.1 to 75

Increment: 0.001

\*RST: 0.1

**Example:** See [Example "Simulating one path TGn fading with two rays with different distributions" on page 205](#).

**Manual operation:** See ["AoD Spread"](#) on page 112

**[:SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:TGN:RAY<st>:GAIN <Gain>**

Sets the relative gain (in dB) of the selected ray.

**Parameters:**

**<Gain>** float

Range: -50 to 0

Increment: 0.001

\*RST: 0

**Example:** See [Example "Simulating one path TGN fading with two rays with different distributions" on page 205](#).

**Manual operation:** See ["Relative Gain /dB"](#) on page 111

**[ :SOURce<hw>]:FSIMulator:MIMO:TAP<ch>:TGN:RAY<st>:STATe <RayState>**

Enables/disables the selected ray.

**Parameters:**

<RayState> 1 | ON | 0 | OFF

\*RST: 0

**Example:** See [Example "Simulating one path TGN fading with two rays with different distributions" on page 205](#).

**Manual operation:** See ["Ray State"](#) on page 111

## 6.8 SCME/WINNER and antenna model settings

Option: R&S SMW-K72/-K73.

**Example: Configuring the settings in SCME/WINNER mode**

The following is a simple example of how to configure the settings.

You can also load the configuration of predefined SCME models automatically, see:

- [Chapter A.16, "SCM and SCME channel models for MIMO OTA", on page 308](#)
- [\[:SOURce<hw>\]:FSIMulator:STANDARD on page 161](#)

```
// Enable 2x2 MIMO configuration
SCONfiguration:MODE ADVanced
SCONfiguration:FADING MIMO2X2
SCONfiguration:APPLY

// select SCME/WINNER matrix mode
// configure the spacial channel model
SOURCE1:FSIMulator:MIMO:TAP TAP1
SOURCE1:FSIMulator:MIMO:TAP1:MATRIX:MODE SCWI
SOURCE1:FSIMulator:MIMO:SCWI:TAP1:SPEEd 30kmh
SOURCE1:FSIMulator:DEL:GROup1:PATH1:SPEEd?
// Response: 8.333

---

[:SOURce<hw>]:FSIMulator:MIMO:SCWI:TAP<st>:SPEed <Speed>

Sets the speed of the mobile station.

**Parameters:**

<Speed>	float
	Range: 0 to 27778
	Increment: 0.001
	*RST: 0.83333

**Example:** See [Example "Configuring the settings in SCME/WINNER mode"](#) on page 208

**Manual operation:** See ["MS Speed"](#) on page 114

---

## [:SOURce&lt;hw&gt;]:FSIMulator:MIMO:SCWI:TAP&lt;st&gt;:DOT &lt;DotAngle&gt;

Sets the direction of travel of the mobile station.

**Parameters:**

<DotAngle>	float
	Range: 0 to 359.9
	Increment: 0.1
	*RST: 90

**Example:** See [Example "Configuring the settings in SCME/WINNER mode"](#) on page 208

**Manual operation:** See ["MS DoT \(Direction of Travel\)"](#) on page 114

---

## [:SOURce&lt;hw&gt;]:FSIMulator:MIMO:SCWI:CLUStEr&lt;ch&gt;:TAP&lt;st&gt;:STATe &lt;State&gt;

Enables/disables the selected cluster.

**Parameters:**

<State>	1   ON   0   OFF
	*RST: 0

**Example:** See [Example "Configuring the settings in SCME/WINNER mode"](#) on page 208

**Manual operation:** See ["Cluster State"](#) on page 114

---

## [:SOURce&lt;hw&gt;]:FSIMulator:MIMO:SCWI:CLUStEr&lt;ch&gt;:GAIN &lt;Gain&gt;

Sets the relative gain (in dB) of the selected cluster.

**Parameters:**

<Gain>	float
	Range: -50 to 0
	Increment: 0.001
	*RST: 0

**Example:** See [Example "Configuring the settings in SCME/WINNER mode"](#) on page 208

**Manual operation:** See ["Relative Gain /dB"](#) on page 114

---

```
[:SOURce<hw>]:FSIMulator:MIMO:SCWI:CLUStEr<ch>:ARRival:ANGLE <Angle>
[:SOURce<hw>]:FSIMulator:MIMO:SCWI:CLUStEr<ch>:DEParture:ANGLE
<Angle>
```

Sets the AoA (angle of arrival) / AoD (angle of departure) of the selected cluster.

**Parameters:**

<Angle> float

Range: 0 to 359.999

Increment: 0.001

\*RST: 0

**Example:** See [Example "Configuring the settings in SCME/WINNER mode"](#) on page 208

**Manual operation:** See ["Angle of Departure \(AoD\)"](#) on page 115

---

```
[:SOURce<hw>]:FSIMulator:MIMO:SCWI:CLUStEr<ch>:ARRival:SPRead
<Spread>
```

```
[:SOURce<hw>]:FSIMulator:MIMO:SCWI:CLUStEr<ch>:DEParture:SPRead
<Spread>
```

Sets the AoA (angle of arrival) / AoD (angle of departure) spread (AS) of the selected cluster.

**Parameters:**

<Spread> float

Range: 1 to 75

Increment: 0.001

\*RST: 1

**Example:** See [Example "Configuring the settings in SCME/WINNER mode"](#) on page 208

**Manual operation:** See ["AoD Spread"](#) on page 115

---

```
[:SOURce<hw>]:FSIMulator:MIMO:SCWI:CLUStEr<ch>:DISTribution <Distribution>
```

Sets one of the Power Azimuth Spectrum (PAS) distributions.

**Parameters:**

<Distribution> LAPLace | GAUSSs | EQUal

\*RST: EQUal

**Example:** See [Example "Configuring the settings in SCME/WINNER mode"](#) on page 208

**Manual operation:** See ["Distribution"](#) on page 115

---

**[:SOURce<hw>]:FSIMulator:MIMO:SCWI:CLUStEr<ch>:TAP<st>:SUBCluStEr<di>:STATe <State>**

If the corresponding cluster is enabled, enables the sub-clusters.

**Suffix:**

<di>                  1 to 3  
                          sub-cluster number

**Parameters:**

<State>              1 | ON | 0 | OFF  
                          \*RST:        0

**Example:**

```
SOURcel:FSIMulator:MIMO:SCWI:CLUStEr2:TAP1:STATe 1
SOURcel:FSIMulator:MIMO:SCWI:CLUStEr2:TAP1:SUBCluStEr2:STATe 1
```

**Manual operation:** See "[Subcluster > State](#)" on page 114

---

**[:SOURce<hw>]:FSIMulator:MIMO:SCWI:CLUStEr<ch>:TAP<st>:SUBCluStEr<di>:GAIN?**

Queries the resulting relative gain of an enabled sub-cluster.

**Suffix:**

<di>                  1 to 3  
                          sub-cluster number

**Return values:**

<Gain>               float  
                         Range: -50 to 0  
                         Increment: 0.001  
                         \*RST:        0

**Example:**

```
SOURcel:FSIMulator:MIMO:SCWI:CLUStEr2:TAP1:STATe 1
SOURcel:FSIMulator:MIMO:SCWI:CLUStEr2:TAP1:SUBCluStEr2:STATe 1
SOURcel:FSIMulator:MIMO:SCWI:CLUStEr2:GAIN 0
SOURcel:FSIMulator:MIMO:SCWI:CLUStEr2:TAP1:SUBCluStEr2:GAIN?
// Response: -5.299
```

**Usage:**              Query only

**Manual operation:** See "[Subcluster > Relative Gain /dB](#)" on page 114

---

**[:SOURce<hw>]:FSIMulator:MIMO:ANTenna:MODeRing[:STATe] <AntennaState>**

Enables/disables simulation of channel polarization.

**Parameters:**

<AntennaState>       1 | ON | 0 | OFF  
                          \*RST:        0

**Example:**              See "[Example "Configuring MIMO-OTA settings"](#) on page 209

**Manual operation:** See "[Channel Polarization State](#)" on page 136

---

**[:SOURce<hw>]:FSIMulator:MIMO:ANTenna:PATTern:MODE <AntModPatMode>**

Sets way the software extracts or calculates the antenna polarization patterns.

**Parameters:**

<AntModPatMode> SEParate | SINGLE  
\*RST: SINGLE

**Example:** See [Example"Configuring MIMO-OTA settings" on page 209](#)

**Options:** SEParate requires option R&S SMW-K73

**Manual operation:** See ["Antenna Polarization Mode"](#) on page 136

---

**[:SOURce]:FSIMulator:MIMO:ANTenna:POLarization:PRATio:HORizontal**  
<AntPolPowRatHor>

**[:SOURce]:FSIMulator:MIMO:ANTenna:POLarization:PRATio:VERTical**  
<AntPolPowRatVer>

Sets the cross polarization power ratio (XPR) in dB.

**Parameters:**

<AntPolPowRatVer> float  
Range: 0 to 20  
Increment: 0.001  
\*RST: 9

**Example:** See [Example"Configuring MIMO-OTA settings" on page 209](#)

**Manual operation:** See ["Vertical/Horizontal Cross Polarization Power Ratio"](#) on page 137

---

**[:SOURce]:FSIMulator:MIMO:ANTenna:RX:POLarization:ANGLE <AntRxPolAngle>**

**[:SOURce<hw>]:FSIMulator:MIMO:ANTenna:TX:POLarization:ANGLE**  
<AntTxPolAngle>

Set the antenna element polarization slant angle.

**Parameters:**

<AntTxPolAngle> POLCROSS45 | POLCROSS90 | POLCO0 | POLCO90  
**POLCROSS45 | POLCROSS90**  
cross-polarization 45°/90°  
**POLCO0 | POLCO90**  
co-polarization 0°/90° (vertical/horizontal polarization)  
\*RST: POLCO0

**Example:** See [Example"Configuring MIMO-OTA settings" on page 209](#)

**Manual operation:** See ["Antenna Polarization Slant Angle"](#) on page 140

---

**[:SOURce]:FSIMulator:MIMO:ANTenna:RX:COLumn:SIZE <AntModRxColSize>**

**[:SOURce]:FSIMulator:MIMO:ANTenna:RX:ROWS:SIZE <AntModRxRowSize>**

**[[:SOURce<hw>]:FSIMulator:MIMO:ANTenna:TX:COLumn:SIZE**  
**<AntModTxColSize>**  
**[[:SOURce<hw>]:FSIMulator:MIMO:ANTenna:TX:ROWS:SIZE** <AntModTxRowSize>  
Sets the number of rows and the number of columns in the antenna array.

**Parameters:**

<AntModTxRowSize> ANT01 | ANT02 | ANT03 | ANT04 | ANT08  
\*RST: ANT01

**Example:** See [Example "Configuring MIMO-OTA settings" on page 209](#)

**Manual operation:** See ["Number of Rows \(M\)/Columns \(N\)" on page 141](#)

**[[:SOURce]:FSIMulator:MIMO:ANTenna:RX:CALC:MODE** <AntModCalcRxMod>  
**[[:SOURce<hw>]:FSIMulator:MIMO:ANTenna:TX:CALC:MODE**  
<AntModCalcRxMod>

Set how the distance between the antenna elements is defined: based on the physical distance or on the relative phase.

**Parameters:**

<AntModCalcRxMod> SPACing | RELativphase

**SPACing**

To set the distance, use the corresponding command, for example [\[:SOURce<hw>\]:FSIMulator:MIMO:ANTenna:TX:ESPacing:Horizontal](#).

**RELativphase**

Load an antenna pattern file that contains the relative phase description.

See [Chapter B, "Antenna pattern file format", on page 348](#)

\*RST: SPACing

**Example:** See [Example "Configuring MIMO-OTA settings" on page 209](#)

**Options:** RELativphase requires option R&S SMW-K73

**Manual operation:** See ["Calculation Mode" on page 141](#)

**[[:SOURce]:FSIMulator:MIMO:ANTenna:RX:ESPacing:CROSSs** <Cross>  
**[[:SOURce<hw>]:FSIMulator:MIMO:ANTenna:TX:ESPacing:CROSSs** <Cross>  
**[[:SOURce]:FSIMulator:MIMO:ANTenna:RX:ESPacing:Horizontal**  
<AntRxEspacHori>  
**[[:SOURce<hw>]:FSIMulator:MIMO:ANTenna:TX:ESPacing:Horizontal**  
<AntTxEspacHori>

Sets the polarized distance between the antennas in the antenna array.

**Parameters:**

<AntTxEspacHori> float  
Range: 0 to 10  
Increment: 0.01  
\*RST: 0.5

<Cross> float  
 Range: 0 to 10  
 Increment: 0.01  
 \*RST: 0

**Example:** See [Example"Configuring MIMO-OTA settings" on page 209](#).

**Manual operation:** See ["Horizontal Spacing"](#) on page 142

#### [**:SOURce**]:FSIMulator:MIMO:ANTenna:PATTern:CATAlog?

Queries the available predefined antenna pattern files (\*.ant\_pat).

To query the user-defined antenna pattern files, use the command [**:SOURce**]:  
**FSIMulator:MIMO:ANTenna:PATTern:CATAlog:USER?**.

**Return values:**

<Catalog> string  
 Files names without file extension.

**Example:** See [Example"Configuring MIMO-OTA settings" on page 209](#)

**Usage:** Query only

**Manual operation:** See ["User Defined Antenna Patterns per Row, Column"](#) on page 143

#### [**:SOURce**]:FSIMulator:MIMO:ANTenna:PATTern:CATAlog:USER? [<CatDir>]

Queries the user-defined antenna pattern files (\*.ant\_pat) in the specified directory.

**Query parameters:**

<CatDir> string  
 File path

**Return values:**

<Catalog> string  
 Files names without file extension.

**Example:** See [Example"Configuring MIMO-OTA settings" on page 209](#)

**Manual operation:** See ["User Defined Antenna Patterns per Row, Column"](#) on page 143

#### [**:SOURce**]:FSIMulator:MIMO:ANTenna:RX:PATTern <AntRxPattDesc>

#### [**:SOURce<hw>**]:FSIMulator:MIMO:ANTenna:TX:PATTern <AntTxPattDesc>

Sets the antenna pattern mode.

**Parameters:**

<AntTxPattDesc> ISOtropic | USER | SEC3 | SEC6 | DIPole | DPISotropic  
 \*RST: ISOtropic

**Example:** See [Example"Configuring MIMO-OTA settings" on page 209](#)

**Manual operation:** See "Antenna Pattern" on page 143

---

[**:SOURce]:FSIMulator:MIMO:ANTenna:RX:ANTenna<di>:PFILE** <RxPattern>  
[:**SOURce<hw>]:FSIMulator:MIMO:ANTenna:TX:ANTenna<di>:PFILE** <TxPattern>

Selects the antenna pattern file (\*.ant\_pat) per antenna.

Query the existing files with the command [**:SOURCE]:FSIMulator:MIMO:ANTenna:PATTERn:CATalog:USER?**.

**Suffix:**

<di> 1 to 8

Value range depends on the selected system configuration, i.e. the number of Tx and Rx antennas in the antenna array

**Parameters:**

<TxPattern> string

Complete file path, incl. the filename; the file extension can be omitted

**Example:** See Example"Configuring MIMO-OTA settings" on page 209

**Manual operation:** See "User Defined Antenna Patterns per Row, Column" on page 143

---

[**:SOURce<hw>]:FSIMulator:MIMO:ANTenna:INVerse:MATRix:STATE**  
<AntModInvMatrix>

Applies the inverse channel matrix to compensate for chamber effects.

To set the matrix values, use the commands [**:SOURce<hw>]:FSIMulator:MIMO:ANTenna:INVerse:MATRix:ROW<st>:COLumn<ch>:REAL** and [**:SOURce<hw>]:FSIMulator:MIMO:ANTenna:INVerse:MATRix:ROW<st>:COLumn<ch>:IMAGin**

**Parameters:**

<AntModInvMatrix> 1 | ON | 0 | OFF

\*RST: 0

**Example:** See Example"Configuring MIMO-OTA settings" on page 209

**Options:** R&S SMW-B14 and R&S SMW-K73

**Manual operation:** See "Use Inverse Channel Matrix" on page 145

---

[**:SOURce<hw>]:FSIMulator:MIMO:ANTenna:INVerse:MATRix:ROW<st>:COLumn<ch>:REAL** <AntModInvMatRea>

[**:SOURce<hw>]:FSIMulator:MIMO:ANTenna:INVerse:MATRix:ROW<st>:COLumn<ch>:IMAGin** <AntModInvMatIma>

Sets the complex elements of the inverse channel matrix.

**Suffix:**

<st>                  1 | 2  
                         Number of row and columns  
                         Current matrix size is 2x2

**Parameters:**

<AntModInvMatIma> float  
                         Range: -1 to 1  
                         Increment: 0.01  
                         \*RST: 0

**Example:** See [Example"Configuring MIMO-OTA settings" on page 209](#)

**Options:** R&S SMW-B14 and R&S SMW-K73

**Manual operation:** See ["Complex Matrix Elements \(Real/Imag\)" on page 146](#)

## 6.9 Two channel interferer

Option: R&S SMW-K71.

### Example: Enabling a two channel interferer fading configuration

The following is a simple example of how to configure and enable a two channel interferer fading configuration.

```

SOURCE1:FSIMulator:CONFIGuration TCI

SOURCE1:FSIMulator:TCInterferer:REFerence:PROFile PDOP
SOURCE1:FSIMulator:TCInterferer:REFerence:LOSS 1
SOURCE1:FSIMulator:TCInterferer:REFerence:SPEed 2
SOURCE1:FSIMulator:TCInterferer:REFerence:FRATio 0.5
SOURCE1:FSIMulator:TCInterferer:REFerence:DELay:MINimum 0.00003
SOURCE1:FSIMulator:TCInterferer:PERiod 160

SOURCE1:FSIMulator:TCInterferer:MOVing:PROFile SPAT
SOURCE1:FSIMulator:TCInterferer:REFerence:LOSS 0
SOURCE1:FSIMulator:TCInterferer:MOVing:DELay:MINimum 0.00003
SOURCE1:FSIMulator:TCInterferer:MOVing:DELay:MAXimum 0.00011
SOURCE1:FSIMulator:TCInterferer:MOVing:MMODe SLID

[:SOURce<hw>]:FSIMulator:TCINterferer:REFerence MOVing:STATe.....	222

**[:SOURce<hw>]:FSIMulator:TCINterferer[:STATe] <State>**

Activates the 2 channel interferer fading configuration.

The paths and the fading simulator must be switched on separately, see [:  
SOURce<hw>]:FSIMulator:TCINterferer:REFerence|MOVing:STATe and [:  
SOURce<hw>]:FSIMulator[:STATe].

**Parameters:**

<State>            1 | ON | 0 | OFF  
                      \*RST:        0

**Example:**        See [Example"Enabling a two channel interferer fading configuration" on page 218](#)

**Manual operation:** See ["Configuration" on page 31](#)  
See ["State" on page 74](#)

**[:SOURce<hw>]:FSIMulator:TCINterferer:REFerence|MOVing:DELay:MAXimum  
<Maximum>**

Sets the maximum delay for the moving path.

**Parameters:**

<Maximum>        float  
                      Range:     dynamic to 0.001  
                      Increment: 20E-9  
                      \*RST:      110E-6

**Example:**        see [Example"Enabling a two channel interferer fading configuration" on page 218](#)

**Manual operation:** See ["Delay Max \(Moving Path\)" on page 76](#)

**[:SOURce<hw>]:FSIMulator:TCINterferer:REFerence|MOVing:MMODe <MMode>**

Selects the type of moving applied to the moving path.

**Parameters:**

<MMode> SLIDing | HOPPing  
\*RST: HOPPing

**Example:** see [Example"Enabling a two channel interferer fading configuration" on page 218](#)

**Manual operation:** See ["Moving Mode \(Moving Path\)" on page 76](#)

---

**[:SOURce<hw>]:FSIMulator:TCINterferer:PERiod <Period>**

Sets either the dwell time or the period for a complete cycle of the moving path.

**Parameters:**

<Period> float  
Range: 0.1 to 10  
Increment: 0.01  
\*RST: 2.9 s (for hopping mode) / 160 s (for sliding mode)

**Example:** See [Example"Enabling a two channel interferer fading configuration" on page 218](#)

**Manual operation:** See ["Period/Dwell" on page 76](#)

---

**[:SOURce<hw>]:FSIMulator:TCINterferer:SPEed <Speed>**

Sets the speed  $v$  of the moving receiver for 2 channel interferer fading.

**Parameters:**

<Speed> float  
Range: 0 to 27778 (dynamic)  
Increment: 0.001  
\*RST: 0.83333

**Example:** See [Example"Enabling a two channel interferer fading configuration" on page 218](#)

**Manual operation:** See ["Speed" on page 75](#)

---

**[:SOURce<hw>]:FSIMulator:TCINterferer:REFerence|MOVing:DELay:MINimum <Minimum>**

Sets the minimum delay for the reference path and the moving path.

**Parameters:**

<Minimum> float  
Range: 0 to dynamic  
Increment: 20E-9  
\*RST: 0

**Example:** See [Example"Enabling a two channel interferer fading configuration" on page 218](#)

**Manual operation:** See "[Delay Min](#)" on page 76

---

**[[:SOURce<hw>](#)]:[FSIMulator](#):[TCINterferer](#):[REFerence|MOVing](#):[FDOPpler](#)?**

Queries the Doppler frequency of the reference and moving path with 2 channel interferer fading.

**Return values:**

<FDoppler> float  
Range: 0 to 1000  
Increment: 0.01  
\*RST: 0

**Example:** See [Example"Enabling a two channel interferer fading configuration"](#) on page 218

**Usage:** Query only

**Manual operation:** See "[Profile](#)" on page 75  
See "[Res. Doppler Shift](#)" on page 75

---

**[[:SOURce<hw>](#)]:[FSIMulator](#):[TCINterferer](#):[REFerence|MOVing](#):[FDOPpler:ACTual](#)?**

Queries the actual Doppler shift.

**Return values:**

<ActDoppler> float  
Range: -1600 to 1600  
Increment: 0.01  
\*RST: 0

**Example:** See [Example"Enabling a two channel interferer fading configuration"](#) on page 218.

**Usage:** Query only

**Manual operation:** See "[Act. Doppler Shift](#)" on page 76

---

**[[:SOURce<hw>](#)]:[FSIMulator](#):[TCINterferer](#):[REFerence|MOVing](#):[FRATio <FRatio>](#)**

Sets the ratio of the actual Doppler frequency to the set Doppler frequency for the reference and moving path with 2 channel interferer fading.

**Parameters:**

<FRatio> float  
Range: -1 to 1  
Increment: 0.0001  
\*RST: 0

**Example:** See [Example"Enabling a two channel interferer fading configuration"](#) on page 218

**Manual operation:** See "[Freq. Ratio](#)" on page 75

---

[:SOURce<hw>]:FSIMulator:TCINterferer:REference|MOVing:LOSS <Loss>

Set the loss of the reference and moving path with 2 channel interferer fading.

**Parameters:**

<Loss>	float
	Range: 0 to 50
	Increment: 0.1
	*RST: 0

**Example:** See [Example"Enabling a two channel interferer fading configuration" on page 218](#)

**Manual operation:** See "[Path Loss](#)" on page 75

---

## [:SOURce&lt;hw&gt;]:FSIMulator:TCINterferer:REference|MOVing:PROFile &lt;Profile&gt;

Sets the fading profile to be used for the reference and moving path with 2 channel interferer fading.

**Parameters:**

<Profile>	SPATH   PDOPpler   RAYLeigh
	*RST: SPATH

**Example:** See [Example"Enabling a two channel interferer fading configuration" on page 218](#)

---

## [:SOURce&lt;hw&gt;]:FSIMulator:TCINterferer:REference|MOVing:STATe &lt;State&gt;

Activate the reference and moving path of the 2 channel interferer fading configuration.

The 2 channel interferer fading configuration and the fading simulator must be switched on separately, see [\[:SOURce<hw>\]:FSIMulator:TCINterferer\[:STATe\] on page 219](#) and [\[:SOURce<hw>\]:FSIMulator\[:STATe\]](#)

**Parameters:**

<State>	1   ON   0   OFF
	*RST: 0

**Example:** See [Example"Enabling a two channel interferer fading configuration" on page 218](#)

**Manual operation:** See "[State](#)" on page 74

## 6.10 Custom fading profile

Option: R&S SMW-K72.

**Example: Enabling, configuring and disabling a custom fading profile**

The following is a simple example of how to configure, enable and disable a custom profile.

```
SOURCE1:FSIMulator:DElay:GROup1:PATH2:PROFile CUSTOM
SOURCE1:FSIMulator:DEL:GROup1:PATH2:CUSTom:DATA 200,100,100,200
SOURCE1:FSIMulator:DEL:GROup1:PATH2:CUSTom:DShape FLAT
SOURCE1:FSIMulator:DEL:GROup1:PATH2:PROFile RAYL
```

**Commands**

---

<a href="#">[:SOURce&lt;hw&gt;]:FSIMulator:DElay DEL:GROup&lt;st&gt;:PATH&lt;ch&gt;:CUSTom:DShape</a> .....	223
<a href="#">[:SOURce&lt;hw&gt;]:FSIMulator:DElay DEL:GROup&lt;st&gt;:PATH&lt;ch&gt;:CUSTom:DATA</a> .....	223

---

**[:SOURce<hw>]:FSIMulator:DElay|DEL:GROup<st>:PATH<ch>:CUSTom:  
DShape <DopplerShape>**

Sets the doppler shape of the virtual profile.

**Parameters:**

<DopplerShape>	FLAT   RAYLeigh
	*RST: RAYLeigh

**Example:** See [Example"Enabling, configuring and disabling a custom fading profile"](#) on page 223

**Manual operation:** See ["Doppler Shape"](#) on page 88

---

**[:SOURce<hw>]:FSIMulator:DElay|DEL:GROup<st>:PATH<ch>:CUSTom:DATA  
<Bandwidth>, <OffsetFreq>, <LowerCutFreq>, <UpperCutFreq>**

Sets the parameters of the custom fading profile.

**Parameters:**

<Bandwidth>	float
	Range: 50 to 40000
	Increment: 1
	*RST: 200
	Default unit: Hz
<OffsetFreq>	float
	Range: -23950 to 23950
	Increment: 1
	*RST: 0
	Default unit: Hz
<LowerCutFreq>	float
	Range: -4000 to 3950
	Increment: 1

**[:SOURce<hw>]:FSIMulator:SCM:D3Mode:STATe <ThreeDMode>**

Enables the 3D geometry-based channel model.

**Parameters:**

<ThreeDMode>      1 | ON | 0 | OFF  
                      \*RST:      0

**Example:**      See [Example "Configuring the 3D geometry-based channel model"](#) on page 225.

**Manual operation:** See ["3D"](#) on page 120

**[:SOURce<hw>]:FSIMulator:SCM:SPEEd <Speed>**

Sets the speed of the mobile station.

**Parameters:**

<Speed>      float  
                     Range:      0 to 27778  
                     Increment: 0.001  
                     \*RST:      0.83333

**Example:**      See [Example "Configuring the SCM fading profile settings"](#) on page 224.

**Manual operation:** See ["MS Speed"](#) on page 118

---

[:SOURce<hw>]:FSIMulator:SCM:DOT <DirOfTravel>

Sets the direction of travel of the mobile station.

**Parameters:**

<DirOfTravel> float  
Range: 0 to 359.9  
Increment: 0.1  
\*RST: 90

**Example:** See [Example "Configuring the SCM fading profile settings"](#) on page 224.

**Manual operation:** See "[MS DoT \(Direction of Travel\)](#)" on page 118

---

## [:SOURce&lt;hw&gt;]:FSIMulator:SCM:SIGMa &lt;Sigma&gt;

Sets the lognormal shadow fading standard deviation, applied as a common parameter to the paths.

**Parameters:**

<Sigma> float  
Range: 0 to 20  
Increment: 0.01  
\*RST: 8

**Example:** See [Example "Configuring the SCM fading profile settings"](#) on page 224.

**Manual operation:** See "[σ<sub>SF</sub>](#)" on page 118

---

## [:SOURce&lt;hw&gt;]:FSIMulator:SCM:PHI &lt;ScmPhi&gt;

Sets the travel azimuth angle.

**Parameters:**

<ScmPhi> float  
Range: 0 to 359.9  
Increment: 0.1  
\*RST: 90

**Example:** See [Example "Configuring the 3D geometry-based channel model"](#) on page 225.

**Manual operation:** See "[MS DoT > φ<sub>v</sub>/Θ<sub>v</sub>](#)" on page 121

---

## [:SOURce&lt;hw&gt;]:FSIMulator:SCM:THETA &lt;ScmTheta&gt;

Sets the elevation angle.

**Parameters:**

<ScmTheta> float  
 Range: 0 to 179.9  
 Increment: 0.1  
 \*RST: 90

**Example:** See [Example "Configuring the 3D geometry-based channel model"](#) on page 225.

**Manual operation:** See ["MS DoT >  \$\phi\_v/\Theta\_v\$ "](#) on page 121

[**:SOURce<hw>]:FSIMulator:SCM:TAP<st>:ARRival:ZENith:ANGLE** <ArrZenith>  
 [**:SOURce<hw>]:FSIMulator:SCM:TAP<st>:DEParture:ZENith:ANGLE**  
 <ZenithDeparture>  
 [**:SOURce<hw>]:FSIMulator:SCM:TAP<st>:ARRival:ANGLE** <Angle>  
 [**:SOURce<hw>]:FSIMulator:SCM:TAP<st>:DEParture:ANGLE** <Angle>  
 Sets the AoA (angle of arrival) / AoD (angle of departure) of the cluster.

**Parameters:**

<Angle> float  
 Range: 0 to 359.999  
 Increment: 0.001  
 \*RST: 0

**Example:** See [Example "Configuring the SCM fading profile settings"](#) on page 224.

**Manual operation:** See ["Angle of Departure \(AoD\)"](#) on page 119

[**:SOURce<hw>]:FSIMulator:SCM:TAP<st>:ARRival:ZENith:SPRead** <ArrZenSpr>

Sets the ZoA (zenith of arrival) spread of the cluster.

**Parameters:**

<ArrZenSpr> float  
 Range: 0 to 75  
 Increment: 0.001  
 \*RST: 1

**Example:** See [Example "Configuring the SCM fading profile settings"](#) on page 224.

**Manual operation:** See ["ZoA Spread"](#) on page 121

[**:SOURce<hw>]:FSIMulator:SCM:TAP<st>:DEParture:ZENith:SPRead**  
 <DepZenSpread>

[**:SOURce<hw>]:FSIMulator:SCM:TAP<st>:ARRival:SPRead** <Spread>  
 [**:SOURce<hw>]:FSIMulator:SCM:TAP<st>:DEParture:SPRead** <Spread>

Sets the AoA (angle of arrival) / AoD (angle of departure) spread (AS) of the cluster.

**Parameters:**

<Spread> float  
Range: 1 to 75  
Increment: 0.001  
\*RST: 1

**Example:** See [Example "Configuring the SCM fading profile settings"](#) on page 224.

**Manual operation:** See ["AoD Spread"](#) on page 119

---

**[:SOURce<hw>]:FSIMulator:SCM:TAP<st>:GAIN <Gain>**

Sets the relative gain (in dB) of the cluster.

**Parameters:**

<Gain> float  
Range: -50 to 0  
Increment: 0.001  
\*RST: 0

**Example:** See [Example "Configuring the SCM fading profile settings"](#) on page 224.

**Manual operation:** See ["Relative Gain /dB"](#) on page 118

---

**[:SOURce<hw>]:FSIMulator:SCM:TAP<st>:SUBCluster<di>:STATe <State>**

Enables the sub-clusters.

**Suffix:**

<di> 1 to 3  
sub-cluster number

**Parameters:**

<State> 1 | ON | 0 | OFF  
\*RST: 0

**Example:** See [Example "Configuring the SCM fading profile settings"](#) on page 224.

**Manual operation:** See ["Subcluster > State"](#) on page 118

---

**[:SOURce<hw>]:FSIMulator:SCM:TAP<st>:SUBCluster<di>:GAIN <Gain>**

Queries the resulting relative gain of an enabled sub-cluster.

**Suffix:**

<di> 1 to 3  
sub-cluster number

**Parameters:**

<Gain> float  
Range: -50 to 0  
Increment: 0.001  
\*RST: 0

**Example:** See [Example "Configuring the SCM fading profile settings"](#) on page 224.

**Manual operation:** See ["Subcluster > Relative Gain /dB"](#) on page 119

---

**[:SOURce<hw>]:FSIMulator:SCM:TAP<st>:SUBPath:STATe <State>**

If enabled, random start phases are selected.

**Parameters:**

<State> 1 | ON | 0 | OFF  
\*RST: 1

**Example:** See [Example "Configuring the SCM fading profile settings"](#) on page 224.

**Manual operation:** See ["Use Random Phases"](#) on page 129

---

**[:SOURce<hw>]:FSIMulator:SCM:POLarization:STATe <State>**

Enables/disables simulation of channel polarization.

**Parameters:**

<State> 1 | ON | 0 | OFF  
\*RST: 0

**Example:** See [Example "Configuring the SCM fading profile settings"](#) on page 224.

**Manual operation:** See ["Channel Polarization State"](#) on page 122

---

**[:SOURce<hw>]:FSIMulator:SCM:POLarization:PRATio:HORizontal  
<RatioHorizontal>****[:SOURce<hw>]:FSIMulator:SCM:POLarization:PRATio:VERTical <RatioVertical>**

Sets the cross polarization power ratio (XPR) in dB.

**Parameters:**

<RatioVertical> float  
Range: 0 to 20  
Increment: 0.001  
\*RST: 9

**Example:** See [Example "Configuring the SCM fading profile settings"](#) on page 224.

**Manual operation:** See "[Vertical/Horizontal Cross Polarization Power Ratio](#)" on page 122

---

**[:SOURce]:FSIMulator:SCM:ANTenna:RX:STRucture <AntennaRxStruct>**  
**[:SOURce<hw>]:FSIMulator:SCM:ANTenna:TX:STRucture <AntennaStruct>**

Sets the antenna array structure.

**Parameters:**

<AntennaStruct> LIN | CROSS  
\*RST: LIN

**Example:** See [Example "Configuring the 3D geometry-based channel model"](#) on page 225.

**Manual operation:** See "[Antenna Structure](#)" on page 124

---

**[:SOURce]:FSIMulator:SCM:ANTenna:RX:CALC:MODE <Mode>**  
**[:SOURce<hw>]:FSIMulator:SCM:ANTenna:TX:CALC:MODE <Mode>**

Set how the phase information is calculated

**Parameters:**

<Mode> SPACing | RELativphase | BFOrming  
**SPACing**  
The phase information is calculated from the spacing between the antenna elements.  
To set the distance, use the corresponding command, for example [\[:SOURce<hw>\]:FSIMulator:SCM:ANTenna:TX:ESPacing:Horizontal](#).

**RELativphase**

Load an antenna pattern file that contains the relative phase description.

See [Chapter B, "Antenna pattern file format"](#), on page 348

**BFOrming**

Composite antenna pattern of an antenna array comprising gain and phase is used to simulate analog beamforming.

To set the distance, use the corresponding command, for example [\[:SOURce<hw>\]:FSIMulator:SCM:ANTenna:TX:ESPacing:Horizontal](#).

\*RST: SPACing

**Example:** See [Example "Configuring the SCM fading profile settings"](#) on page 224.

**Options:** R&S SMW-K73

**Manual operation:** See "[Calculation Mode](#)" on page 124

---

```
[:SOURce]:FSIMulator:SCM:ANTenna:RX:COLumns[:SIZE] <NumRxCol>
[:SOURce]:FSIMulator:SCM:ANTenna:RX:ROWS[:SIZE]?
[:SOURce<hw>]:FSIMulator:SCM:ANTenna:TX:COLumns[:SIZE] <NumTxCol>
[:SOURce<hw>]:FSIMulator:SCM:ANTenna:TX:ROWS[:SIZE]?
```

Queries the number of rows and the number of columns in the antenna array.

**Return values:**

<NumTxRows>	R01   R02   R03   R04   R08
	*RST: R02

**Example:** See [Example "Configuring the SCM fading profile settings"](#) on page 224.

**Usage:** Query only

**Manual operation:** See ["Number of Rows \(M\)/Columns \(N\)"](#) on page 124

---

```
[:SOURce]:FSIMulator:SCM:ANTenna:RX:ESPacing:VERTical <AntenRxSpacVert>
[:SOURce<hw>]:FSIMulator:SCM:ANTenna:TX:ESPacing:VERTical
    <AntTxSpacVertic>
```

```
[:SOURce]:FSIMulator:SCM:ANTenna:RX:ESPacing:HORizontal <SpacingHoriz>
[:SOURce<hw>]:FSIMulator:SCM:ANTenna:TX:ESPacing:HORizontal <Horizontal>
```

Sets the distance between the antennas in the antenna array.

**Parameters:**

<Horizontal>	float
	Range: 0 to 10
	Increment: 0.01
	*RST: 0.5

**Example:** See [Example "Configuring the SCM fading profile settings"](#) on page 224.

**Manual operation:** See ["Horizontal Spacing"](#) on page 125

---

```
[:SOURce]:FSIMulator:SCM:ANTenna:RX:PATTERn <TypeOfPattern>
```

```
[:SOURce<hw>]:FSIMulator:SCM:ANTenna:TX:PATTERn <Pattern>
```

Sets the antenna pattern mode.

**Parameters:**

<Pattern>	ISOtropic   USER   SEC3   SEC6   DIPole   DPISotropic
	*RST: ISOtropic

**Example:** See [Example "Configuring the SCM fading profile settings"](#) on page 224.

**Manual operation:** See ["Antenna Pattern"](#) on page 125

---

**[:SOURce]:FSIMulator:SCM:ANTenna:RX:ANTenna<di>:PFILe <Filename>**  
**[:SOURce<hw>]:FSIMulator:SCM:ANTenna:TX:ANTenna<di>:PFILe <Filename>**

Selects the antenna pattern file (\*.ant\_pat) per antenna.

Query the existing files with the command [\[:SOURCE\]:FSIMulator:MIMO:ANTenna:PATTern:CATalog:USER?](#).

**Suffix:**

<di>                  1 to 8

Value range depends on the selected system configuration, i.e. the number of Tx and Rx antennas in the antenna array

**Parameters:**

<Filename>            string

Complete file path, incl. the filename; the file extension can be omitted

**Example:**

```
// query existing user defined antenna pattern files (*.ant_pat)
SOURce:FSIMulator:MIMO:ANTenna:PATTern:CATalog:USER? "/var/user"
// ant1,ant2
SOURce:FSIMulator:SCM:ANTenna:TX:PATTern USER
SOURce:FSIMulator:SCM:ANTenna:TX:ANTenna1:PFILe "/var/user/ant1"
SOURce:FSIMulator:SCM:ANTenna:TX:ANTenna2:PFILe "/var/user/ant2"
```

**Manual operation:** See ["User Defined Antenna Patterns per Row, Column"](#) on page 126

---

**[:SOURce<hw>]:FSIMulator:SCM:LOS:STATe <State>**

Adds a line-of-sight (LOS) component to the cluster.

**Parameters:**

<State>              1 | ON | 0 | OFF

\*RST:                0

**Example:** See ["Configuring the SCM fading profile settings"](#) on page 224.

**Manual operation:** See ["Use LOS Component"](#) on page 127

---

**[:SOURce<hw>]:FSIMulator:SCM:LOS:ARRival:ZENith:ANGLE <LosZenithOfArr>**  
**[:SOURce<hw>]:FSIMulator:SCM:LOS:DEParture:ZENith:ANGLE**

                          <LosZenithDepar>

**[:SOURce<hw>]:FSIMulator:SCM:LOS:ARRival[:ANGLE] <Angle>**

**[:SOURce<hw>]:FSIMulator:SCM:LOS:DEParture[:ANGLE] <Angle>**

Sets the AoD and AoA of the LOS component.

**Parameters:**

<Angle> float  
Range: 0 to 359.999  
Increment: 0.001  
\*RST: 0

**Example:** See [Example "Configuring the SCM fading profile settings" on page 224](#).

**Manual operation:** See ["LOS Angle of Departure \(AoD\)" on page 127](#)

---

**[:SOURce<hw>]:FSIMulator:SCM:LOS:KFACtor <Factor>**

Sets the ricean K factor.

**Parameters:**

<Factor> float  
Range: -50 to 0  
Increment: 0.001  
\*RST: 0

**Example:** See [Example "Configuring the SCM fading profile settings" on page 224](#).

**Manual operation:** See ["K Factor" on page 128](#)

---

**[:SOURce<hw>]:FSIMulator:SCM:LOS:DISTance <Los3dDistance>**

Sets the distance between the base station (BS) and the user terminal (UT).

**Parameters:**

<Los3dDistance> float  
Range: 0 to 1000  
Increment: 0.01  
\*RST: 0

**Example:** See [Example "Configuring the 3D geometry-based channel model" on page 225](#).

**Manual operation:** See ["3D Distance" on page 128](#)

---

**[:SOURce<hw>]:FSIMulator:SCM:LOS:RANDOM:PHASE:STATE <State>**

If enabled, random subpath start phases are selected.

**Parameters:**

<State> 1 | ON | 0 | OFF  
\*RST: 0

**Example:** See [Example "Configuring the SCM fading profile settings" on page 224](#).

**Manual operation:** See ["Use Random Phases" on page 128](#)

---

[:SOURce<hw>]:FSIMulator:SCM:LOS:RANDOM:PHASE:HH <PhaseHH>  
 [:SOURce<hw>]:FSIMulator:SCM:LOS:RANDOM:PHASE:HV <PhaseHV>

 [:SOURce<hw>]:FSIMulator:SCM:TAP<st>:SUBPath<di>:PHASE:HV <PhaseHV>  
 [:SOURce<hw>]:FSIMulator:SCM:TAP<st>:SUBPath<di>:PHASE:VH <PhaseVH>  
 [:SOURce<hw>]:FSIMulator:SCM:TAP<st>:SUBPath<di>:PHASE:VV <PhaseVV>

Sets the start phase in degree of the LOS signal / the subpath per MIMO channel.

**Suffix:**

<di>                    1 to 20  
                           Subpath number

**Parameters:**

<PhaseVV>	float
	Range: 0 to 359.999
	Increment: 0.001
	*RST: 0

**Example:** See [Example "Configuring the SCM fading profile settings"](#) on page 224.

**Manual operation:** See ["Subpath # > VV/HV/VH/HV Phase"](#) on page 129

## 6.12 Customized dynamic fading

Option: R&S SMW-K820.

**Example: Configuring the customized dynamic fading settings**

```

SCONfiguration:MODE ADV
SCONfiguration:FADING MIMO2X2
SCONfiguration:APPLY

### Example: Using human-readable customized dynamic fading files

Option: R&S SMW-K820.

We assume you have created a file with the required contend and renamed it as described in [Chapter 3.9, "Customized dynamic fading", on page 77](#).

The file `Urban_customer.fad_udyn` is transferred to the R&S SMW.

```
SCOnfiguration:MODE STD
```

```

---

### `[:SOURce<hw>]:FSIMulator:CDYNamic:STATe <State>`

Activates the customized dynamic fading configuration.

**Parameters:**

<State>            1 | ON | 0 | OFF  
                    \*RST:        0

**Example:**        See [Example "Configuring the customized dynamic fading settings" on page 236](#)

**Manual operation:** See ["Configuration" on page 31](#)

---

**[:SOURce<hw>]:FSIMulator:CDYNamic:CATalog?**

Queries the predefined files with customized dynamic fading settings. Listed are files with the file extension \*.fad\_udyn.

**Return values:**

<FileNames>        <filename1>,<filename2>,...  
                    Returns a string of filenames separated by commas.

**Example:**        See [Example "Configuring the customized dynamic fading settings" on page 236](#)

**Usage:**           Query only

**Manual operation:** See ["Filename" on page 80](#)

---

**[:SOURce<hw>]:FSIMulator:CDYNamic:CATalog:USER?**

Queries the files with user-defined customized dynamic fading settings in the default directory. Listed are files with the file extension \*.fad\_udyn.

**Return values:**

<FileNames>        <filename1>,<filename2>,...  
                    Returns a string of filenames separated by commas.

**Example:**        See [Example "Configuring the customized dynamic fading settings" on page 236](#)

**Usage:**           Query only

**Manual operation:** See ["Filename" on page 80](#)

---

**[:SOURce<hw>]:FSIMulator:CDYNamic:PATH<ch>:DATA:DSELect <Filename>**

Loads the selected file from the default or the specified directory. Loaded are files with extension \*.fad\_udyn.

**Suffix:**

<ch>              1 to 12  
                    Fading path

**Parameters:**

<Filename>        "<filename>"  
                    Filename or absolute file path; file extension can be omitted.

**Example:** See [Example "Configuring the customized dynamic fading settings" on page 236](#)

**Manual operation:** See "[Filename](#)" on page 80

---

**[:SOURce<hw>]:FSIMulator:CDYNamic:DELETED <Filename>**

Deletes the specified file. Deleted are user-defined files with file extension \*.fad\_udyn.

**Setting parameters:**

<Filename> "<filename>"  
Complete file path and file name; file extension can be omitted.

**Example:** See [Example "Configuring the customized dynamic fading settings" on page 236](#)

**Usage:** Setting only

**Manual operation:** See "[Filename](#)" on page 80

---

**[:SOURce<hw>]:FSIMulator:CDYNamic:PATH<ch>:PROF <Prof>**

Sets the fading profile.

**Suffix:**

<ch> 1 to 12  
Fading path

**Parameters:**

<Prof> PDOPpler | RAYLeigh | SPATH  
**PDOPpler**  
Pure Doppler profile available in the first four paths  
(PATH1 | 2 | 3 | 4)  
**RAYLeigh**  
Rayleigh profile available for all paths  
**SPATH**  
Static path profile available for all paths  
\*RST: PDOPpler

**Example:** See [Example "Configuring the customized dynamic fading settings" on page 236](#)

**Manual operation:** See "[Profile](#)" on page 80

---

**[:SOURce<hw>]:FSIMulator:CDYNamic:PATH<ch>:STATE <State>**

Activates the selected path, if a customized dynamic file is selected.

**Suffix:**

<ch> 1 to 12  
Fading path

**Parameters:**

<State> 1 | ON | 0 | OFF  
 \*RST: 0

**Example:** See [Example "Configuring the customized dynamic fading settings" on page 236](#)

**Manual operation:** See ["State"](#) on page 80

**[:SOURce<hw>]:FSIMulator:CDYNamic:PATH<ch>:CONVert:STATe**  
 <CdynConvertFile>

Enable to convert files with filename like \*customer\*.fad\_udyn into the Rohde & Schwarz proprietary file format when the fading simulator is enabled.

**Parameters:**

<CdynConvertFile> 1 | ON | 0 | OFF  
 \*RST: 1

**Example:** See [Example "Using human-readable customized dynamic fading files" on page 237.](#)

**Manual operation:** See ["Convert"](#) on page 81

## 6.13 Fading bandwidth

Option: R&S SMW-B15/-K822/-K823

### Example: Enabling signal with 400 MHz fading bandwidth

The following is a simple example on how to configure the settings.

```
SCONfiguration:MODE ADV
SCONfiguration:FADING MIMO2x2x2
SCONfiguration:BBBW BB400
SCONfiguration:CABW?
// BB800
SCONfiguration:APPLY
SCONfiguration:FADING MIMO2x2x4
SCONfiguration:BBBW?
// BB200
SCONfiguration:CABW?
// BB800
```

### Commands

**:SCONfiguration:BBBW <Bandwidth>**

Sets the bandwidth of the baseband signal at the inputs of the fading simulator.

The available values depend on the selected MIMO configuration.

For example:

- In MIMO configurations with fewer than 8 channels, the max. baseband bandwidth is 400 MHz.
- In MIMO configurations with fewer than 4 channels, the max. baseband bandwidth is 800 MHz.

See user manual R&S®SMW-B14/-K71/-K72/-K73/-K74/-K75/-K820/-K821/-K822/-K823 Fading Simulation.

**Parameters:**

<Bandwidth> BB040 | BB050 | BB080 | BB100 | BB160 | BB200 | BB800 | BB400 | BB500 | BB1G | BB2G | BB120 | BBOUTDEF | BB240

**BB040|BB050 ...**

Bandwidth in MHz, e.g. 40 MHz.

**BB1G|BB2G**

1 GHz, 2 GHz bandwidth.

Available in SISO configurations.

**BBOUTDEF**

Bandwidth determined by the signal at the HS DIG I/Q.

**Example:** See [Example"Enabling signal with 400 MHz fading bandwidth"](#) on page 240.

**Options:** R&S SMW-K822  
BB800 requires R&S SMW-K823

**Manual operation:** See ["BB Bandwidth"](#) on page 91

---

**:SCONfiguration:CABW?**

Queries the resulting channel aggregation bandwidth, i.e. the signal bandwidth at the outputs of the stream mapper.

The value is calculated automatically and depends on the selected configuration, the installed options and the selected baseband bandwidth ([:SCONfiguration:BBBW](#)).

See user manual R&S®SMW-B14/-K71/-K72/-K73/-K74/-K75/-K820/-K821/-K822/-K823 Fading Simulation.

**Return values:**

<Bandwidth> BB800 | BB200  
\*RST: depends on options

**Example:** See [Example"Enabling signal with 400 MHz fading bandwidth"](#) on page 240.

**Usage:** Query only

**Options:** R&S SMW-K822/K823

**Manual operation:** See ["CA Bandwidth"](#) on page 91

## Annex

# A Predefined fading settings

The predefined fading settings correspond to the test scenarios defined in the common mobile radio standards. The following tables provide a listing of the predefined standards along with the underlying test scenarios and the enabled settings.

As listed in [Chapter 2.4, "Characteristics of R&S SMW-B14 and R&S SMW-B15"](#), on page 25, there is a difference in the system clocks and the delay resolutions depending on which of the options is installed. These differences also affect the used fading paths and the preset values in some of the predefined fading profiles.

## A.1 CDMA standards

Option: R&S SMW-B14/B15

### A.1.1 CDMA 1 (8km/h - 2 path)

Table A-1: C.S0011-A\_MS\_Minimum\_Performance\_Spec.pdf

	Path 1	Path 2
<b>Profile [Type]</b>	Rayleigh	Rayleigh
<b>Loss [dB]:</b>	0	0
<b>Delay [ns]:</b>	0	2000
<b>LogNormal</b>	off	off
<b>Correlated with:</b>	off	off
<b>Power Ratio [dB]:</b>	0	0
<b>Freq Ratio:</b>	0	0
<b>Speed [km/h]:</b>	8	8

also with 15km/h in band class 5

### A.1.2 CDMA 2 (30km/h - 2 path)

Table A-2: C.S0011-A\_MS\_Minimum\_Performance\_Spec.pdf

	Path 1	Path 2
<b>Profile [Type]</b>	Rayleigh	Rayleigh
<b>Loss [dB]:</b>	0	0
<b>Delay [ns]:</b>	0	2000
<b>LogNormal</b>	off	off
<b>Correlated with:</b>	off	off
<b>Power Ratio [dB]:</b>	0	0
<b>Freq Ratio:</b>	0	0
<b>Speed [km/h]:</b>	30	30

also with 14km/h in band classes 1,4,6,8

also with 58km/h in band class 5

### A.1.3 CDMA 3 (30km/h - 1 path)

Table A-3: C.S0011-A\_MS\_Minimum\_Performance\_Spec.pdf

	Path 1
<b>Profile [Type]</b>	Rayleigh
<b>Loss [dB]:</b>	0

	<b>Path 1</b>
<b>Delay [ns]:</b>	0
<b>LogNormal</b>	off
<b>Correlated with:</b>	off
<b>Power Ratio [dB]:</b>	0
<b>Freq Ratio:</b>	0
<b>Speed [km/h]:</b>	30

also with 58km/h in band class 5

#### A.1.4 CDMA 4 (100km/h - 3 path)

*Table A-4: C.S0011-A\_MS\_Minimum\_Performance\_Spec.pdf*

	<b>Path 1</b>	<b>Path 2</b>	<b>Path 3</b>
<b>Profile [Type]</b>	Rayleigh	Rayleigh	Rayleigh
<b>Loss [dB]:</b>	0	0	3
<b>Delay [ns]:</b>	0	2000	14500
<b>LogNormal</b>	off	off	off
<b>Correlated with:</b>	off	off	off
<b>Power Ratio [dB]:</b>	0	0	0
<b>Freq Ratio:</b>	0	0	0
<b>Speed [km/h]:</b>	100	100	100

also with 192km/h in band class 5

#### A.1.5 CDMA 5 (0km/h - 2 path)

*Table A-5: C.S0011-A\_MS\_Minimum\_Performance\_Spec.pdf*

	<b>Path 1</b>	<b>Path 2</b>
<b>Profile [Type]</b>	Rayleigh	Rayleigh
<b>Loss [dB]:</b>	0	0
<b>Delay [ns]:</b>	0	2000
<b>LogNormal</b>	off	off
<b>Correlated with:</b>	off	off
<b>Power Ratio [dB]:</b>	0	0

	Path 1	Path 2
Freq Ratio:	0	0
Speed [km/h]:	0	0

### A.1.6 CDMA 6 (3km/h - 1 path)

Table A-6: C.S0011-A\_MS\_Minimum\_Performance\_Spec.pdf

	Path 1
Profile [Type]	Rayleigh
Loss [dB]:	0
Delay [ns]:	0
LogNormal	off
Correlated with:	off
Power Ratio [dB]:	0
Freq Ratio:	0
Speed [km/h]:	3

## A.2 GSM standards

Option: R&S SMW-B14/B15

### A.2.1 GSM TU3 (6 path)

	Path 1	Path 2	Path 3	Path 4	Path 5	Path 6
Profile [Type]	Rayleigh	Rayleigh	Rayleigh	Rayleigh	Rayleigh	Rayleigh
Loss [dB]:	3	0	2	6	8	10
Delay [ns]:	0	200	500	1600	2300	5000
LogNormal	off	off	off	off	off	off
Corr with	off	off	off	off	off	off
Power Ratio [dB]:	0	0	0	0	0	0
Freq Ratio:	0	0	0	0	0	0
Speed [km/h]:	3	3	3	3	3	3

### A.2.2 GSM TU50 (6 path)

	<b>Path 1</b>	<b>Path 2</b>	<b>Path 3</b>	<b>Path 4</b>	<b>Path 5</b>	<b>Path 6</b>
<b>Profile [Type]</b>	Rayleigh	Rayleigh	Rayleigh	Rayleigh	Rayleigh	Rayleigh
<b>Loss [dB]:</b>	3	0	2	6	8	10
<b>Delay [ns]:</b>	0	200	500	1600	2300	5000
<b>LogNormal</b>	off	off	off	off	off	off
<b>Corr with</b>	off	off	off	off	off	off
<b>Power Ratio [dB]:</b>	0	0	0	0	0	0
<b>Freq Ratio:</b>	0	0	0	0	0	0
<b>Speed [km/h]:</b>	50	50	50	50	50	50

### A.2.3 GSM HT100 (6 path)

	<b>Path 1</b>	<b>Path 2</b>	<b>Path 3</b>	<b>Path 4</b>	<b>Path 5</b>	<b>Path 6</b>
<b>Profile [Type]</b>	Rayleigh	Rayleigh	Rayleigh	Rayleigh	Rayleigh	Rayleigh
<b>Loss [dB]:</b>	0	1,5	4,5	7,5	8	17,7
<b>Delay [ns]:</b>	0	100	300	500	15000	17200
<b>LogNormal</b>	off	off	off	off	off	off
<b>Corr with</b>	off	off	off	off	off	off
<b>Power Ratio [dB]:</b>	0	0	0	0	0	0
<b>Freq Ratio:</b>	0	0	0	0	0	0
<b>Speed [km/h]:</b>	100	100	100	100	100	100

### A.2.4 GSM RA250 (6 path)

	<b>Path 1</b>	<b>Path 2</b>	<b>Path 3</b>	<b>Path 4</b>	<b>Path 5</b>	<b>Path 6</b>
<b>Profile [Type]</b>	Rice	Rayleigh	Rayleigh	Rayleigh	Rayleigh	Rayleigh
<b>Loss [dB]:</b>	0	4	8	12	16	20
<b>Delay [ns]:</b>	0	100	200	300	400	500
<b>LogNormal</b>	off	off	off	off	off	off
<b>Corr with</b>	off	off	off	off	off	off
<b>Power Ratio [dB]:</b>	6,88	0	0	0	0	0
<b>Freq Ratio:</b>	0,7	0	0	0	0	0
<b>Speed [km/h]:</b>	250	250	250	250	250	250

There has been a change in the specifications TS8916B, Baseline Change from 5.1.0 to 5.2.0. The power ratio for path 1 with Rice fading is now no longer referred only to Rayleigh of path 1. Instead, it is referred to the total power of all of the paths.

The preset value used in the instrument of 6.88 fulfills this requirement. It does not conform to the value given in the specification since the instrument always determines the power ratio for one path. By taking into account the power of the other paths in calculating this value, however, the required power ratio for all six paths is achieved.

### A.2.5 GSM ET50 (EQ50) (6 path)

	Path 1	Path 2	Path 3	Path 4	Path 5	Path 6
<b>Profile [Type]</b>	Rayleigh	Rayleigh	Rayleigh	Rayleigh	Rayleigh	Rayleigh
<b>Loss [dB]:</b>	0	0	0	0	0	0
<b>Delay [ns]:</b>	0	3200	6400	9600	12800	16000
<b>LogNormal</b>	off	off	off	off	off	off
<b>Corr with</b>	off	off	off	off	off	off
<b>Power Ratio [dB]:</b>	0	0	0	0	0	0
<b>Freq Ratio:</b>	0	0	0	0	0	0
<b>Speed [km/h]:</b>	50	50	50	50	50	50

### A.2.6 GSM ET60 (EQ60) (6 path)

	Path 1	Path 2	Path 3	Path 4	Path 5	Path 6
<b>Profile [Type]</b>	Rayleigh	Rayleigh	Rayleigh	Rayleigh	Rayleigh	Rayleigh
<b>Loss [dB]:</b>	0	0	0	0	0	0
<b>Delay [ns]:</b>	0	3200	6400	9600	12800	16000
<b>LogNormal</b>	off	off	off	off	off	off
<b>Corr with</b>	off	off	off	off	off	off
<b>Power Ratio [dB]:</b>	0	0	0	0	0	0
<b>Freq Ratio:</b>	0	0	0	0	0	0
<b>Speed [km/h]:</b>	60	60	60	60	60	60

### A.2.7 GSM ET100 (EQ100) (6 path)

	<b>Path 1</b>	<b>Path 2</b>	<b>Path 3</b>	<b>Path 4</b>	<b>Path 5</b>	<b>Path 6</b>
<b>Profile [Type]</b>	Rayleigh	Rayleigh	Rayleigh	Rayleigh	Rayleigh	Rayleigh
<b>Loss [dB]:</b>	0	0	0	0	0	0
<b>Delay [ns]:</b>	0	3200	6400	9600	12800	16000
<b>LogNormal</b>	off	off	off	off	off	off
<b>Corr with</b>	off	off	off	off	off	off
<b>Power Ratio [dB]:</b>	0	0	0	0	0	0
<b>Freq Ratio:</b>	0	0	0	0	0	0
<b>Speed [km/h]:</b>	100	100	100	100	100	100

### A.2.8 GSM TU3 (12 path)

	<b>Path 1</b>	<b>Path 2</b>	<b>Path 3</b>	<b>Path 4</b>	<b>Path 5</b>	<b>Path 6</b>
<b>Profile [Type]</b>	Rayleigh	Rayleigh	Rayleigh	Rayleigh	Rayleigh	Rayleigh
<b>Loss [dB]:</b>	4	3	0	2,6	3	5
<b>Delay [ns]:</b>	0	100	300	500	800	1100
<b>LogNormal</b>	off	off	off	off	off	off
<b>Corr with</b>	off	off	off	off	off	off
<b>Power Ratio [dB]:</b>	0	0	0	0	0	0
<b>Freq Ratio:</b>	0	0	0	0	0	0
<b>Speed [km/h]:</b>	3	3	3	3	3	3
	<b>Path 7</b>	<b>Path 8</b>	<b>Path 9</b>	<b>Path 10</b>	<b>Path 11</b>	<b>Path 12</b>
<b>Profile [Type]</b>	Rayleigh	Rayleigh	Rayleigh	Rayleigh	Rayleigh	Rayleigh
<b>Loss [dB]:</b>	7	5	6,5	8,6	11	10
<b>Delay [ns]:</b>	1300	1700	2300	3100	3200	5000
<b>LogNormal</b>	off	off	off	off	off	off
<b>Corr with</b>	off	off	off	off	off	off
<b>Power Ratio [dB]:</b>	0	0	0	0	0	0
<b>Freq Ratio:</b>	0	0	0	0	0	0
<b>Speed [km/h]:</b>	3	3	3	3	3	3

### A.2.9 GSM TU50 (12 path)

	<b>Path 1</b>	<b>Path 2</b>	<b>Path 3</b>	<b>Path 4</b>	<b>Path 5</b>	<b>Path 6</b>
<b>Profile [Type]</b>	Rayleigh	Rayleigh	Rayleigh	Rayleigh	Rayleigh	Rayleigh

<b>LogNormal</b>	off
<b>Corr with</b>	off

	<b>Path 1</b>
<b>Power Ratio [dB]:</b>	0
<b>Freq Ratio:</b>	0
<b>Speed [km/h]:</b>	50

## A.6 3GPP standards

Option: R&S SMW-K71

VAx are typical fading profiles, with x representing the speed, such as VA3 represents 3 km/h.

These standards define a certain combination of channels with a specific doppler frequency. Basically, the maximum possible doppler frequency of a path is determined by the RF output frequency and the speed of the moving mobile receiver. However, if you change the RF frequency in a VAx standard, the doppler frequency remains the same, thus resulting in individual speed settings.

Refer also to [Chapter A.6.12, "3GPP mobile VA3, 3GPP mobile VA30, 3GPP mobile VA120"](#), on page 265 for VAx fading profiles.

	Path 8	Path 14	Path 12	Path 13	Path 11	Path 15	Path 16	Path 17	Path 18
Profile [Type]	Rayleigh								
Loss [dB]:	3	4,4	5,9	5,3	7,9	9,4	13,2	16,3	21,2
Delay [ns]:	230	280	330	400	490	600	730	880	1050
LogNormal	off								
Corr with	off								
Power Ratio [dB]:	0	0	0	0	0	0	0	0	0
Freq Ratio:	0	0	0	0	0	0	0	0	0
Speed [km/h]:	10,8	10,8	10,8	10,8	10,8	10,8	10,8	10,8	10,8

### A.7.4 WLAN / hyperlan/2 model d

	Path 4	Path 2	Path 5	Path 1	Path 3	Path 6	Path 7	Path 10	Path 9
Profile [Type]	Rice	Rayleigh							
Loss [dB]:	0	10	10,3	10,6	6,4	7,2	8,1	9	7,9
Delay [ns]:	0	10	20	30	50	80	110	140	180
LogNormal	off								
Corr with	off								
Power Ratio [dB]:	10	0	0	0	0	0	0	0	0
Freq Ratio:	0	0	0	0	0	0	0	0	0
Speed [km/h]:	10,8	10,8	10,8	10,8	10,8	10,8	10,8	10,8	10,8
	Path 8	Path 14	Path 12	Path 13	Path 11	Path 15	Path 16	Path 17	Path 18
Profile [Type]	Rayleigh								
Loss [dB]:	9,4	10,8	12,3	11,7	14,3	15,8	19,6	22,7	27,6
Delay [ns]:	230	280	330	400	490	600	730	880	1050
LogNormal	off								
Corr with	off								
Power Ratio [dB]:	0	0	0	0	0	0	0	0	0
Freq Ratio:	0	0	0	0	0	0	0	0	0
Speed [km/h]:	10,8	10,8	10,8	10,8	10,8	10,8	10,8	10,8	10,8

Corresponds to a typical office environment for "LOS" conditions. A 10db spike at 0 delay has been added resulting in an average rms delay spread of 140ns

### A.7.5 WLAN / hyperlan/2 model e

	Path 5	Path 2	Path 3	Path 4	Path 1	Path 6	Path 7	Path 8	Path 9
Profile [Type]	Rayleigh								
Loss [dB]:	4,9	5,1	5,2	0,8	1,3	1,9	0,3	1,2	2,1
Delay [ns]:	0	10	20	40	70	100	140	190	240
LogNormal	off								
Corr with	off								
Power Ratio [dB]:	0	0	0	0	0	0	0	0	0
Freq Ratio:	0	0	0	0	0	0	0	0	0
Speed [km/h]:	10,8	10,8	10,8	10,8	10,8	10,8	10,8	10,8	10,8
	Path 10	Path 11	Path 15	Path 13	Path 14	Path 12	Path 16	Path 17	Path 18
Profile [Type]	Rayleigh								
Loss [dB]:	0	1,9	2,8	5,4	7,3	10,6	13,4	17,4	20,9
Delay [ns]:	320	430	560	710	880	1070	1280	1510	1760
LogNormal	off								
Corr with	off								
Power Ratio [dB]:	0	0	0	0	0	0	0	0	0
Freq Ratio:	0	0	0	0	0	0	0	0	0
Speed [km/h]:	10,8	10,8	10,8	10,8	10,8	10,8	10,8	10,8	10,8

Corresponds to a typical large open space environment for NLOS conditions and an average rms delay spread of 250ns

### A.8.5 DAB SFN (VHF)

	Path 1	Path 2	Path 3	Path 4	Path 5	Path 6	Path 7
<b>Profile [Type]</b>	Rayleigh	GausDAB	GausDAB	GausDAB	GausDAB	GausDAB	GausDAB
<b>Loss [dB]:</b>	0	13	18	22	26	31	32
<b>Delay [ns]:</b>	0	100000	220000	290000	385000	480000	600000
<b>LogNormal</b>	off	off	off	off	off	off	off
<b>Corr with</b>	off	off	off	off	off	off	off
<b>Power Ratio [dB]:</b>	0	0	0	0	0	0	0
<b>Freq Ratio:</b>	0	0	0	0	0	0	0
<b>Speed [km/h]:</b>	60	60	60	60	60	60	60

Needs both Fading Boards combined, i.e. Signal Routing "A->A(max paths) || B->B(unfaded)" or "A->A(unfaded) || B->B(max paths)".

Do not use Group 5.

## A.9 WIMAX standards

- WiMAX SUI x  
Option: R&S SMW-K72
- WiMAX ITU  
Option: R&S SMW-B14/B15

<b>Frequency [Hz]: *</b>					

**\*) Frequency [Hz] = 1 Hz, 5 Hz, 30 Hz, 70 Hz, 200 Hz, 300 Hz or 600 Hz**

#### A.10.5 MBSFN propagation channel profile (5 hz)

See Chapter A.6.13, "3GPP MBSFN propagation channel profile (18 path)", on page 265.

\* All fading paths use "Frequency = 5 Hz" and "Speed = 5.4 km/h".

### A.10.6 HST 1 open space

See [Chapter A.14.1, "HST1 open space, HST1 open space \(DL+UL\)", on page 305.](#)

### A.10.7 HST 1 500 A/B, HST 3 500 A/B

According to 3GPP TS 36.141, Release 16.

The following applies to all HST scenarios:

- "Signal Dedicated to = Baseband Output"
- "Consider DL RF = Yes"

Fading scenario	HST1-LTE500a	HST1-LTE500b	HST3-LTE500a	HST3-LTE500b
Virtual RF [MHz]	2010	1880	2010	1880
Profile	Pure Doppler	Pure Doppler	Pure Doppler	Pure Doppler
Speed [km/h]:	500	500	500	500
D <sub>min</sub> [m]	50	50	2	2
D <sub>s</sub> [m]	1000	1000	300	300
Virtual DL RF [MHz]	2010	1880	2010	1880

### A.10.8 HST 3 tunnel multi antennas

See [Chapter A.14.3, "HST3 tunnel multi antennas, HST3 tunnel multi antennas \(DL +UL\)", on page 306.](#)

### A.10.9 ETU 200Hz moving

See [Chapter A.15.2, "ETU 200Hz moving \(UL timing adjustment, scenario 1\)", on page 307.](#)

### A.10.10 Pure doppler moving

See [Chapter A.15.3, "Pure doppler moving \(UL timing adjustment, scenario 2\)", on page 308.](#)

## A.11 LTE-MIMO standards

Option: R&S SMW-K74

### A.11.1 EPA (Extended pedestrian A)

See Chapter A.10.2, "EPA (Extended pedestrian A)", on page 291.

### A.11.2 EVA (Extended vehicular A)

	Path 1	Path 2	Path 3	Path 11	Path 12
<b>Profile [Type]</b>	Rayleigh	Rayleigh	Rayleigh	Rayleigh	Rayleigh

## A.14 3GPP/LTE high speed train

Option: R&S SMW-K74 and R&S SMW-K71

### A.14.1 HST1 open space, HST1 open space (DL+UL)

3GPP TS25.141, annex D.4A "High Speed Train" and 3GPP TS36.141, annex B.3 "High Speed Train"

The HST DL+UL standards consider the downlink and the uplink. That is, if a doppler shift occurs in the downlink, the mobile receiver synchronizes to that shifted frequency. The uplink to the base station then results in a doppler shift enlarged by a factor based on the sum of the DL and UL frequency.

	Path 1
Profile [Type]	Pure Doppler
Loss [dB]:	0
Delay [ns]:	0
LogNormal	off
Corr with	off
Power Ratio [dB]:	-
Freq Ratio:	
Speed [km/h]:	350km/h
D <sub>min</sub>	50m
D <sub>s</sub>	1000m

### A.14.2 HST2 tunnel leaky cable, HST2 tunnel leaky cable (DL+UL)

3GPP TS25.141, annex D.4A "High Speed Train"

The HST DL+UL standards consider the downlink and the uplink. That is, if a doppler shift occurs in the downlink, the mobile receiver synchronizes to that shifted frequency. The uplink to the base station then results in a doppler shift enlarged by a factor based on the sum of the DL and UL frequency.

	<b>Path 1</b>
<b>Profile [Type]</b>	Rice
<b>Loss [dB]:</b>	10
<b>Delay [ns]:</b>	0
<b>LogNormal</b>	off
<b>Corr with</b>	off
<b>Power Ratio [dB]:</b>	0
<b>Freq Ratio:</b>	1
<b>Speed [km/h]:</b>	300km/h

### A.14.3 HST3 tunnel multi antennas, HST3 tunnel multi antennas (DL+UL)

3GPP TS25.141, annex D.4A "High Speed Train" and 3GPP TS36.141, annex B.3A "High Speed Train"

The HST DL+UL standards consider the downlink and the uplink. That is, if a doppler shift occurs in the downlink, the mobile receiver synchronizes to that shifted frequency. The uplink to the base station then results in a doppler shift enlarged by a factor based on the sum of the DL and UL frequency.

	<b>Path 1</b>
<b>Profile [Type]</b>	Pure Doppler
<b>Loss [dB]:</b>	0
<b>Delay [ns]:</b>	0
<b>LogNormal</b>	off
<b>Corr with</b>	off
<b>Power Ratio [dB]:</b>	-
<b>Freq Ratio:</b>	
<b>Speed [km/h]:</b>	300km/h
<b>D<sub>min</sub></b>	2m
<b>D<sub>s</sub></b>	300m

### A.15 3GPP/LTE moving propagation

Option: R&S SMW-K71

### A.15.1 Reference + moving channel

Table A-34: 3GPP TS 25.101, annex B2.3

	Path 1	Path 2
<b>Profile [Type]</b>	Static	Static
<b>Loss [dB]:</b>	0	0
<b>Delay [ns]:</b>	0	1 to 6us
<b>LogNormal</b>	off	off
<b>Corr with</b>	off	off
<b>Power Ratio [dB]:</b>	0	0
<b>Freq Ratio:</b>	1	1
<b>Speed [km/h]:</b>	0	0

Period:  $157,0796s = 2\pi/\text{0.04}$

(Mean)-Delay:  $3.5\mu\text{s}$

### A.15.2 ETU 200Hz moving (UL timing adjustment, scenario 1)

Table A-35: 3GPP TS36.141, annex B.4 "Moving Propagation Conditions"

	Path 1	Path 2	Path 3	Path 4	Path 5

	Path 6	Path 7	Path 8	Path 9
Doppler [Hz]:				
Speed [km/h]:	120	120	120	120

Period:  $157,0796s = 2\pi/0.04$

Amplitude:  $5\mu s = 10\mu s/2$

### A.15.3 Pure doppler moving (UL timing adjustment, scenario 2)

Table A-36: 3GPP TS36.141, annex B.4 "Moving Propagation Conditions"

	Path 1
Profile [Type]	Pure Doppler
Loss [dB]:	0
Delay [ns]:	0
LogNormal	off
Corr with	off
Power Ratio [dB]:	0
Doppler [Hz]:	
Speed [km/h]:	350

Period:  $48,33s = 2\pi/0.13$

Amplitude:  $5\mu s = 10\mu s/2$

## A.16 SCM and SCME channel models for MIMO OTA

Option: R&S SMW-K72

The SCM/SCME models define 6 clusters characterized by the delay, the AoA/AoD, AS and PAS shape.

These channel models are defined for 2x2 MIMO configuration and cannot be loaded in other MIMO configurations.

### SCME models

The following antenna polarization and antenna pattern settings apply for all **SCME** models.

Antenna settings	Polarization	Distance ( $d_a$ )	Antenna pattern
Tx	Cross 45°	0	Dipole
Rx	Horizontal	0.5λ	Isotropic

**Geo SCME models**

The following antenna polarization and antenna pattern settings apply for all **Geo SCME**:

- "Polarization = On"
- "LOS component = Off"
- " $\sigma_{SF} = 8 \text{ dB}$ "
- "Use random start phases = On"

Antenna settings	Distance ( $d_a$ )	Antenna pattern
Tx	0	Dipole +45°/-45°
Rx	0.5λ	Vertical dipole

### A.16.1 SCME/Geo SCME urban micro-cell channel (UMi) 3 km/h and 30 km/h

## A.18 802.11n-SISO standards

Option: R&S SMW-B14/B15

These fading profiles are implemented as the IEEE 802.11n-MIMO models, expect that:

- Correlation Path = Off
- Coefficient, % = 100
- Phase, deg = 0

See [Chapter A.19, "802.11n-MIMO standards"](#), on page 314.

## A.19 802.11n-MIMO standards

Option: R&S SMW-K71

According to IEEE 802.11-03/940r4

Rx Antenna Distance = 1

Tx Antenna Distance = 0.5

Distribution = Laplace

Profile = Bell Shape tgn Indoor, exception Model F, Path 3 where the Profile = Bell Shape tgn Moving Vehicle

Speed = 1.2 km/h, exception Model F, Path 3 where Speed = 40 km/h

## A.20 802.11ac-MIMO standards

Option: R&S SMW-K71

The 802.11ac-MIMO channel models are conform for channel bandwidth  $\leq 40$  MHz.

According to IEEE 802.11-03/940r4

Rx Antenna Distance = 1

Tx Antenna Distance = 0.5

Distribution = Laplace

Profile = Bell Shape tgn Indoor, exception Model F, Path 3 where the Profile = Bell Shape tgn Moving Vehicle

Speed = 0.089 km/h, exception Model F, Path 3 where Speed = 40 km/h

## A.21 802.11ac-SISO standards

Option: R&S SMW-B14/B15

These fading profiles are implemented as the IEEE 802.11ac-MIMO models, expect that:

- Correlation Path = Off
- Coefficient, % = 100
- Phase, deg = 0

See [Chapter A.20, "802.11ac-MIMO standards"](#), on page 324.

## A.22 802.11p channel models

Option: R&S SMW-B14/B15

According to C2C-CC TF Antennae & Wireless Performance – Whitepaper Vs 1.0

- Fading Profile = Custom
- Doppler Shape = Rayleigh
- Bandwidth =  $2 * \text{abs}(f_d)$
- Frequency Offset = 0 Hz
- for  $f_d > 0$ :
  - Lower Cutoff Frequency = 0
  - Upper Cutoff Frequency =  $f_d$
- for  $f_d < 0$ :
  - Lower CutOff Frequency =  $-f_d$
  - Upper CutOff Frequency = 0

### A.22.1 Rural LOS

This channel model is intended primarily as a reference result. It applies in very open environments where other vehicles, buildings and large fences are absent.

	Path 1	Path 2	Path 3
<b>Profile [Type]</b>	Static	Custom	Custom
<b>(Relative) Loss [dB]:</b>	0	14	17
<b>Delay [ns]:</b>	0	83	183
<b><math>f_d</math> [Hz]</b>	0	492	-295

### A.22.2 Urban approaching LOS

Two vehicles approaching each other in an urban setting with buildings nearby.

	Path 1	Path 2	Path 3	Path 4
<b>Profile [Type]</b>	Static	Custom	Custom	Custom
<b>(Relative) Loss [dB]:</b>	0	8	10	15
<b>Delay [ns]:</b>	0	117	183	333
<b>f<sub>D</sub> [Hz]</b>	0	236	-157	492

### A.22.3 Urban crossing NLOS

Two vehicles approaching an Urban blind intersection with other traffic present. Buildings/fences present on all corners.

	Path 1	Path 2	Path 3	Path 4
<b>Profile [Type]</b>	Static	Custom	Custom	Custom
<b>(Relative) Loss [dB]:</b>	0	3	5	10
<b>Delay [ns]:</b>	0	267	400	533
<b>f<sub>D</sub> [Hz]</b>	0	295	-98	591

### A.22.4 Highway LOS

Two cars following each other on Multi-lane inter-region roadways such as German autobahns and USA Interstates. Signs, overpasses, hill-sides and other traffic present.

	Path 1	Path 2	Path 3	Path 4
<b>Profile [Type]</b>	Static	Custom	Custom	Custom
<b>(Relative) Loss [dB]:</b>	0	10	15	20
<b>Delay [ns]:</b>	0	100	167	500
<b>f<sub>D</sub> [Hz]</b>	0	689	-492	886

### A.22.5 Highway NLOS

As for Highway LOS but with occluding trucks present between the vehicles.

	Path 1	Path 2	Path 3	Path 4
<b>Profile [Type]</b>	Static	Custom	Custom	Custom
<b>(Relative) Loss [dB]:</b>	0	2	5	7

	Path 1	Path 2	Path 3	Path 4
Delay [ns]:	0	200	433	700
f <sub>D</sub> [Hz]	0	689	-492	886

## A.23 5G NR standards

Option: R&S SMW-B14/B15; MIMO profiles require R&S SMW-K74.

According to 3GPP [TS 38.101-4](#) and [TS 38.141-1](#).

The following settings apply to all paths:

- Path state = On; "Path x (off)" explicitly states inactive paths
- Profile type = Rayleigh
- LogNormal = Off
- Corr with = Off
- Power ratio = 0 dB
- Speed = 0 km/h

### Channel models naming convention

The names of the channel models follow the syntax:

FR<1 | 2> TDL<A | B | C><delay spread, ms>-<Doppler, Hz> <Low/Med/Med A/High/SISO>, where:

- FR designates the frequency band (FR1 below 6GHz, FR2 above 6GHz)
- Low/Med/Med A/High indicates the MIMO correlation matrix
- SISO designates the non-MIMO case; SISO and MIMO profiles are identical but in the SISO case correlation matrix is not relevant.
- [FR1 TDLA30-5/10 SISO/Low/Med/Med A/High.....](#) 337
- [FR1 TDLB100-400 SISO/Low/Med/Med A/High.....](#) 338
- [FR1 TDLC300-100 SISO/Low/Med/High.....](#) 339
- [FR1 TDLC300-400 SISO.....](#) 339

Fine delay required	1	1	-	-	-

### A.23.7 FR1 NTN TDLA100-200 Low/Med/High

These profiles have a Doppler frequency of 200 Hz ( $f_C = 1$  GHz) for all paths.

Parameter	Path 1	Path 2	Path 3	Path 4 (off)	Path 5 (off)
"Path Loss (dB)"	0	4.7	6.5	-	-

"Resulting Delay (ns)"	0	110	285	-	-
Fine delay required	0	1	1	-	-

### A.23.8 FR1 NTN TDLC5-200 Low/Med/High

These profiles have a Doppler frequency of 200 Hz ( $f_C = 1$  GHz) for all paths.

Parameter	Path 1	Path 2	Path 3	Path 4 (off)	Path 5 (off)
"Path Loss (dB)"	0.6	8.9	21.5	-	-
"Resulting Delay (ns)"	0	0	60	-	-
Fine delay required	0	0	1	-	-

### A.23.9 FR2 TDLA30-35/75/300 SISO/Low/Med/Med A/High

The fading profile uses the same path settings as the settings defined for the FR1 TDLA30-5/10 Hz profiles. For the FR2 profiles merely the Doppler frequency changes to 35 Hz, 75 Hz and 300 Hz.

See Chapter A.23.1, "FR1 TDLA30-5/10 SISO/Low/Med/Med A/High", on page 337.

### A.23.10 FR2 TDLC60-300 SISO/Low/Med/Med A/High

These profiles have a Doppler frequency of 300 Hz for all paths.

Parameter	Path 1	Path 2	Path 3	Path 4	Path 5
"Path Loss (dB)"	7.8	0.3	0	8.9	14.5
"Resulting Delay (ns)"	0	15	40	50	55

Fine delay required	0	9	-	-	-

### A.23.11 MIMO parameter

The MIMO correlation matrices for the high, medium and low antenna correlation are configured according to [TS 38.101-4](#), section B.2.3.

## A.24 5G NR MIMO OTA channel models

Option: R&S SMW-B14/B15; MIMO profiles require R&S SMW-K72/-K73/-K74.

According to 3GPP [TR 38.827](#).

The CDL channel models are defined for FR1 and FR2 MIMO-OTA testing. The following applies for fading standards:

- The fading profile for all models and all paths is SCM.
- All channel models are 3D channel models with enabled channel polarization
- 5G NR MIMO OTA standards are available for the specified LxMxN system configuration (see [Chapter 5, "Multiple input multiple output \(MIMO\)", on page 94](#)).
- A set of predefined 3D antenna patterns is available and used for each predefined scenario. The file selection of the antenna pattern also considers the fader dedicated frequency for FR1 models.
- UE velocity v is defined as follows:
  - for FR1, v = 30km/h
  - for FR2, v = 3 km/h (InO) and v = 12 km/h (UMi).
- Subpath start phases are preset for each predefined scenario.
- The DoT value for CDL-B is selected according to R4-1915060.
- SCM model parameters and the per cluster parameters are set automatically.

### Channel models naming convention

The names of the channel models follow the syntax:

FR<1 | 2> CDL<A | B | C> <Umi | Uma | InO>, where:

- FR designates the frequency band (FR1 below 7.125 GHz, FR2 above 24.250 GHz)
- UMi = Urban micro-cell
- UMa = Urban macro-cell
- InO = Indoor office

### A.24.1 FR1 CDL-A/-B/-C UMa 2x2

- "System Configuration = 1x2x2"
- Velocity [km/h] = 30 km/h

	<b>CDL-A</b>	<b>CDL-B</b>	<b>CDL-C</b>
DoT [phi,theta]	182.17°, 90°	90°, 90°	65°, 90°

#### A.24.2 FR1 CDL-A/-B/-C UMi 4x4

- "System Configuration = 1x4x4"
- Velocity [km/h] = 30 km/h

	<b>CDL-A</b>	<b>CDL-B</b>	<b>CDL-C</b>
DoT [phi,theta]	135°, 90°	90°, 90°	127.05°, 90°

#### A.24.3 FR1 CDL-C UMa 4x4

- "System Configuration = 1x4x4"
- Velocity [km/h] = 30 km/h

	<b>CDL-A</b>	<b>CDL-B</b>	<b>CDL-C</b>
DoT [phi,theta]	182.17°, 90°	90°, 90°	65°, 90°

#### A.24.4 FR1 CDL-C UMi 2x2

- "System Configuration = 1x2x2"
- Velocity [km/h] = 30 km/h

	<b>CDL-A</b>	<b>CDL-B</b>	<b>CDL-C</b>
DoT [phi,theta]	135°, 90°	90°, 90°	127.05°, 90°

#### A.24.5 FR2 CDL-A InO

- "System Configuration = 1x2x2"
- Velocity [km/h] = 12 km/h
- DoT [phi,theta] = 74.11°, 90°

#### A.24.6 FR2 CDL-C UMi

- "System Configuration = 1x2x2"
- Velocity [km/h] = 3 km/h
- DoT [phi,theta] = 112.51°, 90°

## A.25 5G NR high speed train

Option: R&S SMW-K74 and R&S SMW-K71

The following applies to all HST scenarios:

- "Signal Dedicated to = Baseband Output"
- "Consider DL RF = Yes"

### A.25.1 HST1 NR350 15 kHz/30 kHz SCS

3GPP [TS 38.104](#), [TS 38.141-1](#) and [TS 38.141-2](#)

Fading scenario	HST1 NR350 15 kHz SCS	HST1 NR350 30 kHz SCS
Virtual RF [MHz]	1950	3600
Profile	Pure Doppler	Pure Doppler
Speed [km/h]:	350	350
D <sub>min</sub> [m]	150	150
D <sub>s</sub> [m]	700	1000
Virtual DL RF [MHz]	1950	3600

### A.25.2 HST1 NR500 15 kHz/30 kHz SCS

3GPP [TS 38.104](#), [TS 38.141-1](#) and [TS 38.141-2](#)

Fading scenario	HST1 NR500 15 kHz SCS	HST1 NR500 30 kHz SCS

## B Antenna pattern file format

Antenna pattern files are XML files in the Rohde & Schwarz proprietary antenna pattern file format. These files use the predefined file extension \*.ant\_pat. They describe the antenna power response matrix as an array with resolutions of 1 degree to 5 degrees for both the elevation and the azimuth angles. In their minimum format, antenna pattern files contain only the loss values for a given azimuth angle. For an isotropic antenna for instance, that radiates the energy equally in all directions, the array elements are all 0 dB.

Antenna pattern files can also include the relative phase and antenna polarization information.

Parsing of antenna pattern files containing relative phase and polarization information requires option R&S SMW-K73.

The antenna pattern file format uses a generic file structure for both 2D and 3D antenna models (see [Figure B-1](#)). It can be seen as a table with the following parts:

- Header row comprising the azimuth angles (`<az_values>`)
- First column defining the zenith angles (`<zenith>`)
- A data part describing the antenna power response (`<power>`).

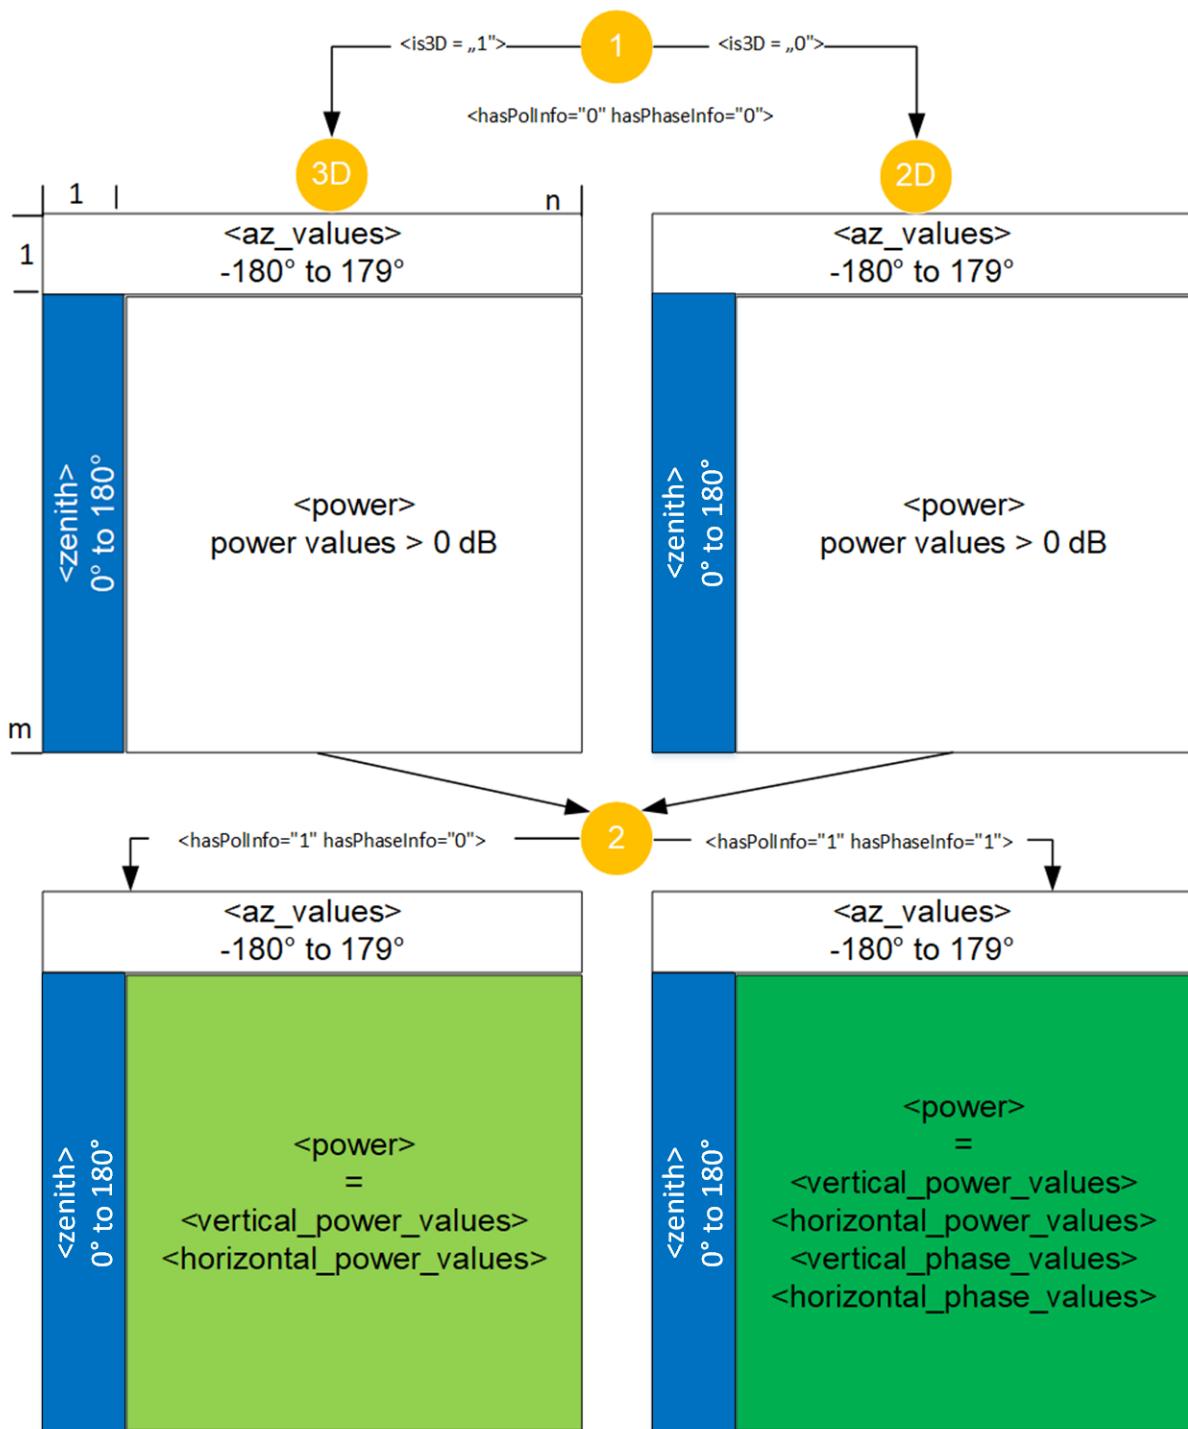

The table can have different number of columns (1 to n), depending on the azimuth resolution (`<az_res>`). The number of rows depends on the zenith resolution (`<elev_res>`).

The `<is3D>` element defines if the pattern is a 2D or a 3D antenna model; if `<is3D = "1">` a three-dimensional antenna pattern description is required.

Depending on the antenna type, there are three possibilities to describe the antenna power response:

- Single polarized antenna  
Antenna power only (`<hasPolInfo>` and `<hasPhaseInfo>` are not specified)  
See 1) on [Figure B-1](#)
- Dual-polarized antenna  
Vertical and horizontal power descriptions (`<hasPolInfo="1" hasPhaseInfo="0">`)  
See 2) on [Figure B-1](#)
- Dual-polarized antenna  
Vertical and horizontal relative phase descriptions, additional to the vertical and horizontal power descriptions (`<hasPolInfo="1" hasPhaseInfo="1">`)  
See 2) on [Figure B-1](#)

For details on the file syntax, see [Table B-1](#).

**Figure B-1: File format structure**

- 1       = 3D antenna model, if `is3D="1"` and 2D - if `is3D="0"`
- 1 to n   = Number of columns, depending on `<az_res>`
- 1 to m   = Number of rows, depending on `<elev_res>`
- 2       = Combination of `<hasPollInfo>` and `<hasPhaseInfo>` and the meaning for the `<data>` part

**Example: Antenna with three sectors (3Sectors.ant\_pat) as specified in TR 25.996 (extract)**

According to [TR 25.996](#), the 3 sector antenna pattern is used for each sector. The following equation describes the antenna pattern:

$$A(\Theta) = -\min [12(\Theta/\Theta_{3dB})^2, A_m]$$

Where:

- $-180^\circ \leq \Theta < 180^\circ$  is the angle between the direction of interest and the boresight of the antenna
- $\Theta_{3dB}$  is the 3 dB beamwidth in degrees
- $A_m$  is the maximum attenuation

For the 3 sector scenario  $\Theta = 70$  deg and  $A_m = 40$  dB.

**Note:** The antenna pattern files define the antenna **power** and not the antenna gain.

```
<?xml version="1.0" encoding="ISO-8859-1"?>
<antenna_pattern>
    <antenna_descr count="1">
        </antenna_descr>

### File syntax

The [Table B-1](#) describes the used tags and parameters.

**Table B-1: Format of \*.ant\_pat file**

Tag name	Parameter	Description
<antenna_pattern>		Defines antenna pattern file
<antenna_descr>		Contains the descriptions of the antennas
	<count>	Number of antenna patterns; value = 1 always
<antenna>		Descriptions of the individual antenna
	<hasPolInfo>	<p>Indicates if the file contains the vertical and horizontal power information or not.</p> <ul style="list-style-type: none"> <li>• "0": single polarized antenna, power information only (Antenna polarization is set with the parameter <a href="#">Antenna Polarization Slant Angle</a>)</li> <li>• "1": dual polarized antenna, vertical and horizontal power information included</li> </ul> <p>The <b>vertical and horizontal power</b> descriptions are mandatory</p>
	<hasPhaseInfo>	<p>Indicates if the file contains relative phase description or not.</p> <ul style="list-style-type: none"> <li>• "0": no relative phase information</li> <li>• "1": relative phase information included</li> </ul> <p>The <b>relative phase</b> description is mandatory If also &lt;hasPolInfo="1"&gt;, both the vertical and the horizontal relative phase descriptions are mandatory</p>
	<is3D>	<p>Indicates if the file describes a 3D antenna model or not.</p> <ul style="list-style-type: none"> <li>• "0": 2D model</li> <li>• "1": 3D model</li> </ul>
<az_res>		<p>Azimuth resolution of the antenna pattern description (&lt;data&gt; tag)</p> <p>Value in degrees integer divider of 360</p> <p>Value range: - 180° to 179°</p>
<elev_res>		<p>Elevation resolution of the &lt;data&gt; tag</p> <p>Value in degrees integer divider of 180</p>
<data>		<p>Antenna pattern description as an array with:</p> <ul style="list-style-type: none"> <li>• [1 + 360/&lt;az_res&gt;] columns <ul style="list-style-type: none"> <li>– <b>2D</b> antenna model: The <b>first</b> column indicates the elevation angle used to create the 2D pattern out of the 3D pattern. It is usually 0°.</li> <li>– <b>3D</b> antenna model: The <b>first</b> column indicates the <b>zenith</b>. It is value in the range 0 to 180°</li> </ul> </li> <li>• 2 to 5 rows, depending on the &lt;hasPolInfo&gt; and the &lt;hasPhaseInfo&gt; tags</li> </ul> <p>The first row lists the azimuth angles &lt;az_values&gt;*).</p> <p>The second row describes antenna power response in terms of <b>loss values</b> in dB; the power values are positive values, calculated as:</p> $20 \cdot \log_{10}(\text{LinearGain})$ <p>If &lt;hasPolInfo="1"&gt;, the descriptions of the <b>vertical and horizontal power response</b> of the antenna is mandatory.</p> <p>Required are two rows, for the vertical and the horizontal information; always in this order.</p> <p>If &lt;hasPhaseInfo="1"&gt;, the <b>relative phase</b> description is mandatory.</p> <p>Required are one or, if &lt;hasPolInfo="1"&gt;, two rows - for the vertical and the horizontal information; always in this order.</p> <p>Allowed are values in the range 0 rad to 2pi rad.</p>

<sup>\*)</sup> If the azimuth angles (<az\_values>) are given with lower resolution than the resolution specified with the <az\_res> element, an interpolation is applied.

### How to create an antenna pattern file from the measured values

The radiated antenna pattern of the DUT is the measurement result of the stage 1 in the two stage MIMO OTA test method (see "About the MIMO OTA two stage method" on page 130). The following is an overview of the general steps required to convert the measured antenna pattern values into the Rohde & Schwarz 2D antenna pattern format.

#### General steps

1. Convert the azimuth value to the values range of -180° to 180°.
2. Convert the magnitude values expressed in dBm into loss values expressed in dB. Calculate the required power values as  $20 * \log_{10}(\text{LinearGain})$
3. Interpolate the values to achieve an azimuth resolution of 1°.
4. Create the 2D antenna pattern file.

The example on Figure B-2 illustrates the required steps.

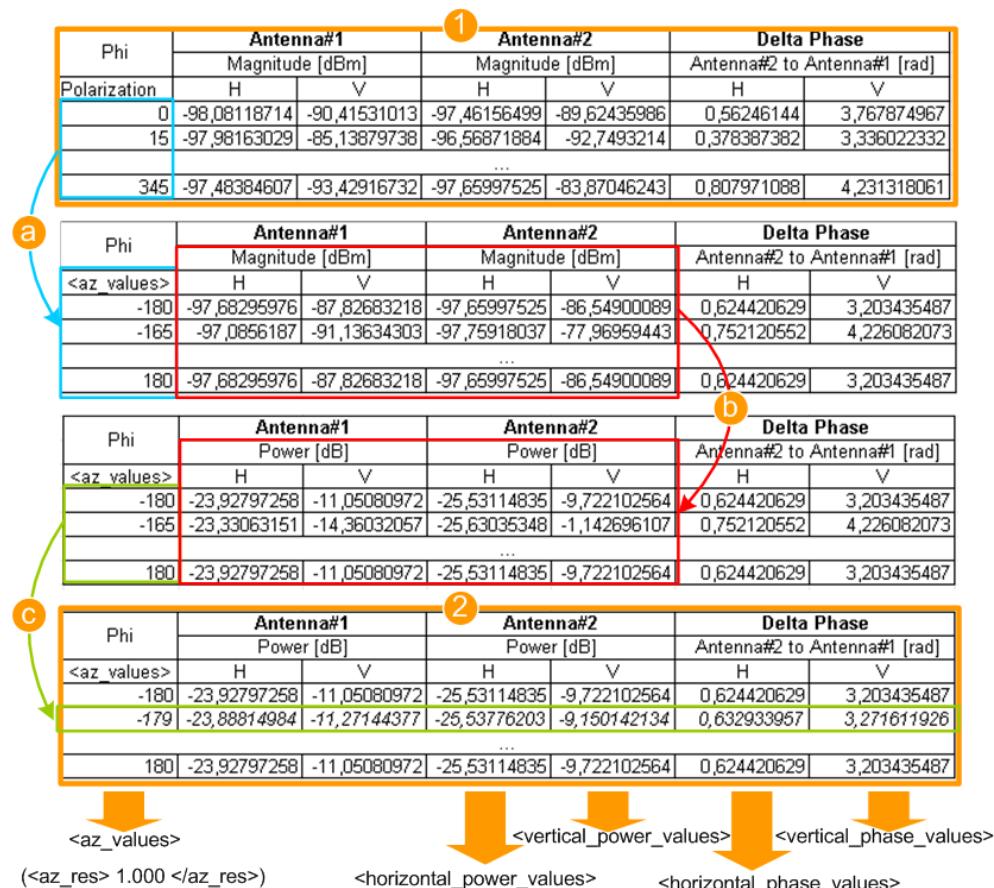

Figure B-2: Converting custom data into the Rohde & Schwarz 2D antenna pattern file format

```
1 = Input file (extract, shows the first two and the last row)
H, V = Horizontal and vertical polarization values
a = Convert angle value for 0° to 360 ° to <az_values> = -180° to 179°
b = Convert magnitude values [dBm] to power [dB]
c = Interpolate the values
2 = Converted and interpolated values to achieve azimuth resolution of 1°
<horizontal_power_values>, = Power values > 0 dB
<vertical_power_values>
```

The example shows how to create the antenna pattern file of antenna #2. An extract of antenna pattern file content is listed in [Example "Antenna pattern with polarization and relative phase information \(extract\)" on page 351](#). The created file contains relative phase information and the description of the vertical and the horizontal polarizations (<antenna hasPhaseInfo="1" hasPolInfo="1"/>).

Create the antenna pattern file of antenna #1 in the same way but set the <vertical\_phase\_values> = <horizontal\_phase\_values> = 0.

# Index

## Symbols

2 Channel Interferer ..... 71

## A

Accept Correlation Values ..... 106

Actual Doppler Shift

  2 Channel Interferer ..... 76

  Birth Death ..... 63

Additional delay ..... 51

Antenna array

  Antenna spacing ..... 125, 142

  Number of rows/columns ..... 124, 141

  Relative phase ..... 124, 141

Antenna Distance ..... 111

Antenna polarization

  Angle ..... 140

  Number of rows/columns ..... 124, 141

  Relative phase ..... 124, 141

  Spacing cross-polarization ..... 142

  Spacing horizontal/vertical ..... 125, 142

Antennas array ..... 138

Application cards ..... 16

Application notes ..... 16

Array Structure

  Tx/Rx antennas ..... 138

Auto detect output ..... 34

## B

Basic delay ..... 51

Birth Death Propagation ..... 57, 183

Brochures ..... 16

Bypass if fading off

  Description ..... 146

  Enable during troubleshooting ..... 148

## C

CDF

  Customized dynamic fading ..... 77

Chamber effects

  Compensate ..... 145

Channel aggregation bandwidth ..... 91

Channel model

  IEEE 802.11p ..... 87

Channel polarization

  Cross polarization ..... 122, 137

  Pattern files with polarization information ..... 136

  Polarization mode ..... 136

  State ..... 122, 136

Channel polarization matrix ..... 137

cHST ..... 77

Clipped Samples ..... 43, 155

Clock rate ..... 34
